

# Part IB — Quantum Mechanics

## Theorems

Based on lectures by J. M. Evans

Notes taken by Dexter Chua

Michaelmas 2015

These notes are not endorsed by the lecturers, and I have modified them (often significantly) after lectures. They are nowhere near accurate representations of what was actually lectured, and in particular, all errors are almost surely mine.

### **Physical background**

Photoelectric effect. Electrons in atoms and line spectra. Particle diffraction. [1]

### **Schrödinger equation and solutions**

De Broglie waves. Schrödinger equation. Superposition principle. Probability interpretation, density and current. [2]

Stationary states. Free particle, Gaussian wave packet. Motion in 1-dimensional potentials, parity. Potential step, square well and barrier. Harmonic oscillator. [4]

### **Observables and expectation values**

Position and momentum operators and expectation values. Canonical commutation relations. Uncertainty principle. [2]

Observables and Hermitian operators. Eigenvalues and eigenfunctions. Formula for expectation value. [2]

### **Hydrogen atom**

Spherically symmetric wave functions for spherical well and hydrogen atom.

Orbital angular momentum operators. General solution of hydrogen atom. [5]

## **0 Introduction**

### **0.1 Light quanta**

### **0.2 Bohr model of the atom**

### **0.3 Matter waves**

# 1 Wavefunctions and the Schrödinger equation

## 1.1 Particle state and probability

## 1.2 Operators

## 1.3 Time evolution of wavefunctions

**Proposition.** The probability density

$$P(x, t) = |\Psi(x, t)|^2$$

obeys a conservation equation

$$\frac{\partial P}{\partial t} = -\frac{\partial j}{\partial x},$$

where

$$j(x, t) = -\frac{i\hbar}{2m} \left( \Psi^* \frac{d\Psi}{dx} - \frac{d\Psi^*}{dx} \Psi \right)$$

is the *probability current*.

## **2 Some examples in one dimension**

### **2.1 Introduction**

### **2.2 Infinite well — particle in a box**

### **2.3 Parity**

### **2.4 Potential well**

### **2.5 The harmonic oscillator**

### 3 Expectation and uncertainty

#### 3.1 Inner products and expectation values

**Proposition.** The operators  $\hat{x}$ ,  $\hat{p}$  and  $H$  are all Hermitian (for real potentials).

**Proposition** (Cauchy-Schwarz inequality). If  $\psi$  and  $\phi$  are any normalizable states, then

$$\|\psi\|\|\phi\| \geq |(\psi, \phi)|.$$

#### 3.2 Ehrenfest's theorem

**Theorem** (Ehrenfest's theorem).

$$\begin{aligned}\frac{d}{dt}\langle\hat{x}\rangle_{\Psi} &= \frac{1}{m}\langle\hat{p}\rangle_{\Psi} \\ \frac{d}{dt}\langle\hat{p}\rangle_{\Psi} &= -\langle V'(\hat{x})\rangle_{\Psi}.\end{aligned}$$

#### 3.3 Heisenberg's uncertainty principle

**Theorem** (Heisenberg's uncertainty principle). If  $\psi$  is any normalized state (at any fixed time), then

$$(\Delta x)_{\psi}(\Delta p)_{\psi} \geq \frac{\hbar}{2}.$$

## 4 More results in one dimensions

### 4.1 Gaussian wavepackets

### 4.2 Scattering

### 4.3 Potential step

### 4.4 Potential barrier

### 4.5 General features of stationary states

## 5 Axioms for quantum mechanics

### 5.1 States and observables

### 5.2 Measurements

**Proposition.** Let  $Q$  be Hermitian (an observable), i.e.  $Q^\dagger = Q$ . Then

- (i) Eigenvalues of  $Q$  are real.
- (ii) Eigenstates of  $Q$  with different eigenvalues are orthogonal (with respect to the complex inner product).
- (iii) Any state can be written as a (possibly infinite) linear combination of eigenstates of  $Q$ , i.e. eigenstates of  $Q$  provide a basis for  $V$ . Alternatively, the set of eigenstates is *complete*.

**Proposition.**

- (i) The expectation value of  $Q$  in state  $\psi$  is

$$\langle Q \rangle_\psi = (\psi, Q\psi) = \sum \lambda_n P_n,$$

with notation as in the previous part.

- (ii) The uncertainty  $(\delta Q)_\psi$  is given by

$$(\Delta Q)_\psi^2 = \langle (Q - \langle Q \rangle_\psi)^2 \rangle_\psi = \langle Q^2 \rangle_\psi - \langle Q \rangle_\psi^2 = \sum_n (\lambda_n - \langle Q \rangle_\psi)^2 P_n.$$

### 5.3 Evolution in time

**Theorem** (Ehrenfest's theorem). If  $Q$  is any operator with no explicit time dependence, then

$$i\hbar \frac{d}{dt} \langle Q \rangle_\Psi = \langle [Q, H] \rangle_\Psi,$$

where

$$[Q, H] = QH - HQ$$

is the commutator.

### 5.4 Discrete and continuous spectra

### 5.5 Degeneracy and simultaneous measurements

## 6 Quantum mechanics in three dimensions

### 6.1 Introduction

### 6.2 Separable eigenstate solutions

### 6.3 Angular momentum

**Proposition.**

(i)  $[L_i, L_j] = i\hbar\varepsilon_{ijk}L_k$ .

(ii)  $[\mathbf{L}^2, L_i] = 0$ .

(iii)  $[L_i, \hat{x}_j] = i\hbar\varepsilon_{ijk}\hat{x}_k$  and  $[L_i, \hat{p}_j] = i\hbar\varepsilon_{ijk}\hat{p}_k$

### 6.4 Joint eigenstates for a spherically symmetric potential

## **7 The hydrogen atom**

### **7.1 Introduction**

### **7.2 General solution**

### **7.3 Comments**
