

THE MATHEMATICAL TRIPOS 2010-2011

CONTENTS

This booklet contains the schedule, or syllabus specification, for each course of the undergraduate Tripos together with information about the examinations. It is updated every year. Suggestions and corrections should be e-mailed to faculty@maths.cam.ac.uk.

SCHEDULES

Syllabus

The schedule for each lecture course is a list of topics that define the course. The schedule is agreed by the Faculty Board. Some schedules contain topics that are ‘starred’ (listed between asterisks); all the topics must be covered by the lecturer but examiners can only set questions on unstarred topics.

The numbers which appear in brackets at the end of subsections or paragraphs in these schedules indicate the approximate number of lectures likely to be devoted to that subsection or paragraph. Lecturers decide upon the amount of time they think appropriate to spend on each topic, and also on the order in which they present to topics. For some courses in Parts IA and IB, there is not much flexibility, because some topics have to be introduced by a certain time in order to be used in other courses.

Recommended books

A list of books is given after each schedule. Books marked with † are particularly well suited to the course. Some of the books are out of print; these are retained on the list because they should be available in college libraries (as should all the books on the list) and may be found in second-hand bookshops. There may well be many other suitable books not listed; it is usually worth browsing.

Most books on the list have a price attached: this is based on the most up to date information available at the time of production of the schedule, but it may not be accurate.

STUDY SKILLS

The Faculty produces a booklet *Study Skills in Mathematics* which is distributed to all first year students and can be obtained in pdf format from www.maths.cam.ac.uk/undergrad/studyskills.

There is also a booklet that gives guidance to supervisors *Supervision in Mathematics* obtainable from www.maths.cam.ac.uk/facultyoffice/supervisorsguide/ which may also be of interest to students.

EXAMINATIONS

Overview

There are three examinations for the undergraduate Mathematical Tripos: Parts IA, IB and II. They are normally taken in consecutive years. This page contains information that is common to all three examinations. Information that is specific to individual examinations is given later in this booklet in the *General Arrangements* sections for the appropriate part of the Tripos.

The form of each examination (number of papers, numbers of questions on each lecture course, distribution of questions in the papers and in the sections of each paper, number of questions which may be attempted) is determined by the Faculty Board. The main structure has to be agreed by University committees and is published as a Regulation in the Statutes and Ordinances of the University of Cambridge. Any significant change to the format is announced in the *Reporter* as a Form and Conduct notice. The actual questions and marking schemes, and precise borderlines (following general classing criteria agreed by the Faculty Board) are determined by the examiners.

The examiners for each part of the Tripos are appointed by the General Board of the University. The internal examiners are normally teaching staff of the two mathematics departments and they are joined by one or more external examiners from other universities.

Form of the examination

The examination for each part of the Tripos consists of four written papers and candidates take all four. For Parts IB and II, candidates may in addition submit Computational Projects. Each written paper has two sections: Section I contains questions that are intended to be accessible to any student who has studied the material conscientiously. They should not contain any significant ‘problem’ element. Section II questions are intended to be more challenging.

Calculators are not allowed in any paper of the Mathematical Tripos; questions will be set in such a way as not to require the use of calculators. The rules for the use of calculators in the Physics paper of Option (b) of Part IA are set out in the regulations for the Natural Sciences Tripos.

Formula booklets are not permitted, but candidates will not be required to quote elaborate formulae from memory.

Past papers

Past Tripos papers for the last 10 or more years can be found on the Faculty web site <http://www.maths.cam.ac.uk/undergrad/pastpapers/>. Solutions and mark schemes are not available except in rough draft form for supervisors.

Marking conventions

Section I questions are marked out of 10 and Section II questions are marked out of 20. In addition to a numerical mark, extra credit in the form of a quality mark may be awarded for each question depending on the completeness and quality of each answer. For a Section I question, a *beta* quality mark is awarded for a mark of 8 or more. For a Section II question, an *alpha* quality mark is awarded for a mark of 15 or more, and a *beta* quality mark is awarded for a mark between 10 and 14, inclusive.

The Faculty Board recommends that no distinction should be made between marks obtained on the Computational Projects courses and marks obtained on the written papers.

On some papers, there are restrictions on the number of questions that may be attempted, indicated by a rubric of the form ‘*You may attempt at most N questions in Section I.*’ The Faculty policy is that examiners mark all attempts, even if the number of these exceeds that specified in the rubric, and the candidate is assessed on the best attempts consistent with the rubric. This policy is intended to deal with candidates who accidentally violate the rubric: it is clearly not in candidates’ best interests to tackle more questions than is permitted by the rubric.

Examinations are ‘single-marked’, but safety checks are made on all scripts to ensure that all work is marked and that all marks are correctly added and transcribed. Scripts are identified only by candidate number until the final class-lists have been drawn up. In drawing up the class list, examiners make decisions based only on the work they see: no account is taken of the candidates’ personal situation or of supervision reports. Candidates for whom a warning letter has been received may be removed from the class list pending an appeal. All appeals must be made through official channels (via a college tutor if you are seeking an allowance due to, for example, ill health; either via a college tutor or directly to the Registry if you wish to appeal against the mark you were given: for further information, a tutor or the CUSU web site should be consulted). Examiners should not be approached either by candidates or their directors of studies as this might jeopardise any formal appeal.

Classification Criteria

As a result of each examination, each candidate is placed in one of the following categories: first class, upper second class (2.1), lower second class (2.2), third class, ordinary, fail or ‘other’. ‘Other’ here includes, for example, candidates who were ill for all or part of the examination. In the exceptionally unlikely event of your being placed in the ordinary or fail categories, you should contact your tutor or director of studies at once: if you wish to continue to study at Cambridge an appeal (based, for example, on medical evidence) must be made to the Council of the University. The regulations do not permit you to resit a Tripos examination.

Quality marks as well as numerical marks are taken into account by the examiners in deciding the class borderlines. The Faculty Board has recommended that the primary classification criteria for each borderline be:

First / upper second	$30\alpha + 5\beta + m$
Upper second / lower second	$15\alpha + 5\beta + m$
Lower second / third	$15\alpha + 5\beta + m$
Third/ ordinary	$2\alpha + \beta$ together with m

Here, m denotes the number of marks and α and β denote the numbers of quality marks.

At the third/ordinary and ordinary/fail borderlines, individual considerations are always paramount.

Very careful scrutiny is given to candidates near any borderlines and other factors besides marks and quality marks may be taken into account.

Classification Criteria (continued)

The Faculty Board recommends approximate percentages of candidates for each class: 30% firsts; 40-45% upper seconds; 20-25% lower seconds; and up to 10% thirds. These percentages should exclude candidates who did not take the examination.

The Faculty Board intends that the classification criteria described above should result in classes that can be characterized as follows:

First Class

Candidates placed in the first class will have demonstrated a good command and secure understanding of examinable material. They will have presented standard arguments accurately, showed skill in applying their knowledge, and generally will have produced substantially correct solutions to a significant number of more challenging questions.

Upper Second Class

Candidates placed in the upper second class will have demonstrated good knowledge and understanding of examinable material. They will have presented standard arguments accurately and will have shown some ability to apply their knowledge to solve problems. A fair number of their answers to both straightforward and more challenging questions will have been substantially correct.

Lower Second Class

Candidates placed in the lower second class will have demonstrated knowledge but sometimes imperfect understanding of examinable material. They will have been aware of relevant mathematical issues, but their presentation of standard arguments will sometimes have been fragmentary or imperfect. They will have produced substantially correct solutions to some straightforward questions, but will have had limited success at tackling more challenging problems.

Third Class

Candidates placed in the third class will have demonstrated some knowledge but little understanding of the examinable material. They will have made reasonable attempts at a small number of questions, but will have lacked the skills to complete many of them.

Ordinary

Candidates granted an allowance towards an Ordinary Degree will have demonstrated knowledge of a small amount of examinable material by making reasonable attempts at some straightforward questions.

Data Protection Act

To meet the University’s obligations under the Data Protection Act (1998), the Faculty deals with data relating to individuals and their examination marks as follows:

- Marks for individual questions and Computational Projects are released routinely after the examinations.
- Scripts are kept, in line with the University policy, for four months following the examinations (in case of appeals) and are then destroyed.
- Neither the Data Protection Act nor the Freedom of Information Act entitle candidates to have access to their scripts. However, data appearing on individual examination scripts are available on application to the University Data Protection Officer and on payment of a fee. Such data would consist of little more than ticks, crosses, underlines, and mark subtotals and totals.

MISCELLANEOUS MATTERS

Numbers of supervisions

Directors of Studies will arrange supervisions for each course as they think appropriate. Lecturers will hand out examples sheets which supervisors may use if they wish. According to Faculty Board guidelines, the number of examples sheets for 24-lecture, 16-lecture and 12-lecture courses should be 4, 3 and 2, respectively.

Transcripts

In order to conform to government guidelines on examinations, the Faculty is obliged to produce, for use in transcripts, data that will allow students to determine roughly their position within each class. The examiners officially do no more than place each candidate in a class, but the Faculty authorises a percentage mark to be given, via CamSIS, to each candidate for each examination. The percentage mark is obtained by piecewise linear scaling of merit marks within each class. The 2/1, 2.1/2.2, 2.2/3 and 3/ordinary boundaries are mapped to 70%, 60%, 50% and 40% respectively. These percentage marks are usually available by September of the relevant year.

Feedback

Constructive feedback of all sorts and from all sources is welcomed by everyone concerned in providing courses for the Mathematical Tripos.

There are many different feedback routes. Each lecturer hands out a questionnaire towards the end of the course and students are sent a combined online questionnaire at the end of each year. These questionnaires are particularly important in shaping the future of the Tripos and the Faculty Board urge all students to respond. To give feedback during the course of the term, students can e-mail the Faculty Board and Teaching Committee students representatives and anyone can e-mail the anonymous rapid response Faculty 'hotline' hotline@maths.cam.ac.uk. Feedback can be sent directly to the Teaching Committee via the Faculty Office. Feedback on college-provided teaching can be given to Directors of Studies or Tutors at any time.

Student representatives

There are three student representatives on the Faculty Board, and two on each of the the Teaching Committee and the Curriculum Committee. They are normally elected (in the case of the Faculty Board representatives) or appointed in November of each year. Their role is to advise the committees on the student point of view, to collect opinion from and liaise with the student body. They operate a website: <http://www.damtp.cam.ac.uk/user/studrep> and their email address is student.reps@damtp.cam.ac.uk.

Aims and objectives

The **aims** of the Faculty for Parts IA, IB and II of the Mathematical Tripos are:

- to provide a challenging course in mathematics and its applications for a range of students that includes some of the best in the country;
- to provide a course that is suitable both for students aiming to pursue research and for students going into other careers;
- to provide an integrated system of teaching which can be tailored to the needs of individual students;
- to develop in students the capacity for learning and for clear logical thinking;
- to continue to attract and select students of outstanding quality;
- to produce the high calibre graduates in mathematics sought by employers in universities, the professions and the public services.
- to provide an intellectually stimulating environment in which students have the opportunity to develop their skills and enthusiasms to their full potential;
- to maintain the position of Cambridge as a leading centre, nationally and internationally, for teaching and research in mathematics.

The **objectives** of Parts IA, IB and II of the Mathematical Tripos are as follows:

After completing Part IA, students should have:

- made the transition in learning style and pace from school mathematics to university mathematics;
- been introduced to basic concepts in higher mathematics and their applications, including (i) the notions of proof, rigour and axiomatic development, (ii) the generalisation of familiar mathematics to unfamiliar contexts, (iii) the application of mathematics to problems outside mathematics;
- laid the foundations, in terms of knowledge and understanding, of tools, facts and techniques, to proceed to Part IB.

After completing Part IB, students should have:

- covered material from a range of pure mathematics, statistics and operations research, applied mathematics, theoretical physics and computational mathematics, and studied some of this material in depth;
- acquired a sufficiently broad and deep mathematical knowledge and understanding to enable them both to make an informed choice of courses in Part II and also to study these courses.

After completing Part II, students should have:

- developed the capacity for (i) solving both abstract and concrete problems, (ii) presenting a concise and logical argument, and (iii) (in most cases) using standard software to tackle mathematical problems;
- studied advanced material in the mathematical sciences, some of it in depth.

Part IA

GENERAL ARRANGEMENTS

Structure of Part IA

There are two options:

- (a) Pure and Applied Mathematics;
- (b) Mathematics with Physics.

Option (a) is intended primarily for students who expect to continue to Part IB of the Mathematical Tripos, while Option (b) is intended primarily for those who are undecided about whether they will continue to Part IB of the Mathematical Tripos or change to Part IB of the Natural Sciences Tripos (Physics option).

For Option (b), two of the lecture courses (Numbers and Sets, and Dynamics and Relativity) are replaced by the complete Physics course from Part IA of the Natural Sciences Tripos; Numbers and Sets because it is the least relevant to students taking this option, and Dynamics and Relativity because much of this material is covered in the Natural Sciences Tripos anyway. Students wishing to examine the schedules for the physics courses should consult the documentation supplied by the Physics department, for example on <http://www.phy.cam.ac.uk/teaching/>.

Examinations

Arrangements common to all examinations of the undergraduate Mathematical Tripos are given on pages 1 and 2 of this booklet.

All candidates for Part IA of the Mathematical Tripos take four papers, as follows.

Candidates taking Option (a) (Pure and Applied Mathematics) will take Papers 1, 2, 3 and 4 of the Mathematical Tripos (Part IA).

Candidates taking Option (b) (Mathematics with Physics) take Papers 1, 2 and 3 of the Mathematical Tripos (Part IA) and the Physics paper of the Natural Sciences Tripos (Part IA); they must also submit practical notebooks.

For Mathematics with Physics candidates, the marks and quality marks for the Physics paper are scaled to bring them in line with Paper 4.

Examination Papers

Papers 1, 2, 3 and 4 of Part IA of the Mathematical Tripos are divided into two Sections. There are four questions in Section I and eight questions in Section II. Candidates may attempt all the questions in Section I and at most five questions from Section II, of which no more than three may be on the same lecture course.

Each section of each of Papers 1—4 is divided equally between two courses as follows:

Paper 1:	Vectors and Matrices, Analysis I
Paper 2:	Differential Equations, Probability
Paper 3:	Groups, Vector Calculus
Paper 4:	Numbers and Sets, Dynamics and Relativity.

Approximate class boundaries

The merit mark, M , is defined in terms of raw mark m , number of alphas, α , and number of betas, β , by

$$M = \begin{cases} 30\alpha + 5\beta + m - 120 & \text{for } \alpha \geq 8 \\ 15\alpha + 5\beta + m & \text{for } \alpha \leq 8 \end{cases}$$

The following table shows the approximate borderlines. The first column of data shows a sufficient criterion (in terms of the primary classification criteria stated on page 1 of this booklet) for each class. The second and third columns show the merit mark, raw mark, number of alphas and number of betas of two representative candidates placed just above the borderline. The sufficient condition for each class is not prescriptive: it is just intended to be helpful for interpreting the data. Each candidate near a borderline is scrutinised individually. The data given below are relevant to one year only; borderlines may go up or down in future years.

PartIA 2010			
Class	Sufficient condition	Borderline candidates	
1	$M > 624$	625/330,13,5	634/364,11,12
2.1	$M > 400$	398/248,8,6	406/261,6,11
2.2	$M > 290$	295/195,5,5	295/220,3,6
3	$m > 180$ or $2\alpha + \beta > 7$	196/156,0,8	210/175,1,4

GROUPS

24 lectures, Michaelmas term

Examples of groups

Axioms for groups. Examples from geometry: symmetry groups of regular polygons, cube, tetrahedron. Permutations on a set; the symmetric group. Subgroups and homomorphisms. Symmetry groups as subgroups of general permutation groups. The Möbius group; cross-ratios, preservation of circles, the point at infinity. Conjugation. Fixed points of Möbius maps and iteration. [4]

Lagrange's theorem

Cosets. Lagrange's theorem. Groups of small order (up to order 8). Quaternions. Fermat-Euler theorem from the group-theoretic point of view. [5]

Group actions

Group actions; orbits and stabilizers. Orbit-stabilizer theorem. Cayley's theorem (every group is isomorphic to a subgroup of a permutation group). Conjugacy classes. Cauchy's theorem. [4]

Quotient groups

Normal subgroups, quotient groups and the isomorphism theorem. [4]

Matrix groups

The general and special linear groups; relation with the Möbius group. The orthogonal and special orthogonal groups. Proof (in \mathbb{R}^3) that every element of the orthogonal group is the product of reflections and every rotation in \mathbb{R}^3 has an axis. Basis change as an example of conjugation. [3]

Permutations

Permutations, cycles and transpositions. The sign of a permutation. Conjugacy in S_n and in A_n . Simple groups; simplicity of A_5 . [4]

Appropriate books

VECTORS AND MATRICES

24 lectures, Michaelmas term

Complex numbers

Review of complex numbers, including complex conjugate, inverse, modulus, argument and Argand diagram. Informal treatment of complex logarithm, n -th roots and complex powers. de Moivre's theorem. [2]

Vectors

Review of elementary algebra of vectors in \mathbb{R}^3 , including scalar product. Brief discussion of vectors in \mathbb{R}^n and \mathbb{C}^n ; scalar product and the Cauchy-Schwarz inequality. Concepts of linear span, linear independence, subspaces, basis and dimension.

Suffix notation: including summation convention, δ_{ij} and ϵ_{ijk} . Vector product and triple product: definition and geometrical interpretation. Solution of linear vector equations. Applications of vectors to geometry, including equations of lines, planes and spheres. [5]

Matrices

Elementary algebra of 3×3 matrices, including determinants. Extension to $n \times n$ complex matrices. Trace, determinant, non-singular matrices and inverses. Matrices as linear transformations; examples of geometrical actions including rotations, reflections, dilations, shears; kernel and image. [4]

Simultaneous linear equations: matrix formulation; existence and uniqueness of solutions, geometric interpretation; Gaussian elimination. [3]

Symmetric, anti-symmetric, orthogonal, hermitian and unitary matrices. Decomposition of a general matrix into isotropic, symmetric trace-free and antisymmetric parts. [1]

Eigenvalues and Eigenvectors

Eigenvalues and eigenvectors; geometric significance. [2]

Proof that eigenvalues of hermitian matrix are real, and that distinct eigenvalues give an orthogonal basis of eigenvectors. The effect of a general change of basis (similarity transformations). Diagonalization of general matrices: sufficient conditions; examples of matrices that cannot be diagonalized. Canonical forms for 2×2 matrices. [5]

Discussion of quadratic forms, including change of basis. Classification of conics, cartesian and polar forms. [1]

Rotation matrices and Lorentz transformations as transformation groups. [1]

Appropriate books

Alan F Beardon *Algebra and Geometry*. CUP 2005 (£21.99 paperback, £48 hardback)

Gilbert Strang *Linear Algebra and Its Applications*. Thomson Brooks/Cole, 2006 (£42.81 paperback)

Richard Kaye and Robert Wilson *Linear Algebra*. Oxford science publications, 1998 (£23)

D.E. Bourne and P.C. Kendall *Vector Analysis and Cartesian Tensors*. Nelson Thornes 1992 (£30.75 paperback)

E. Sernesi *Linear Algebra: A Geometric Approach*. CRC Press 1993 (£38.99 paperback)

James J. Callahan *The Geometry of Spacetime: An Introduction to Special and General Relativity*. Springer 2000 (£51)

NUMBERS AND SETS

24 lectures, Michaelmas term

[Note that this course is omitted from Option (b) of Part IA.]

Introduction to numbers systems and logic

Overview of the natural numbers, integers, real numbers, rational and irrational numbers, algebraic and transcendental numbers. Brief discussion of complex numbers; statement of the Fundamental Theorem of Algebra.

Ideas of axiomatic systems and proof within mathematics; the need for proof; the role of counter-examples in mathematics. Elementary logic; implication and negation; examples of negation of compound statements. Proof by contradiction. [2]

Sets, relations and functions

Union, intersection and equality of sets. Indicator (characteristic) functions; their use in establishing set identities. Functions; injections, surjections and bijections. Relations, and equivalence relations. Counting the combinations or permutations of a set. The Inclusion-Exclusion Principle. [4]

The integers

The natural numbers: mathematical induction and the well-ordering principle. Examples, including the Binomial Theorem. [2]

Elementary number theory

Prime numbers: existence and uniqueness of prime factorisation into primes; highest common factors and least common multiples. Euclid's proof of the infinity of primes. Euclid's algorithm. Solution in integers of $ax+by = c$.

Modular arithmetic (congruences). Units modulo n . Chinese Remainder Theorem. Wilson's Theorem; the Fermat-Euler Theorem. Public key cryptography and the RSA algorithm. [8]

The real numbers

Least upper bounds; simple examples. Least upper bound axiom. Sequences and series; convergence of bounded monotonic sequences. Irrationality of $\sqrt{2}$ and e . Decimal expansions. Construction of a transcendental number. [4]

Countability and uncountability

Definitions of finite, infinite, countable and uncountable sets. A countable union of countable sets is countable. Uncountability of \mathbb{R} . Non-existence of a bijection from a set to its power set. Indirect proof of existence of transcendental numbers. [4]

Appropriate books

 I. Stewart and D. Tall *The Foundations of Mathematics*. Oxford University Press 1977 (£22.50 paperback)

DIFFERENTIAL EQUATIONS

24 lectures, Michaelmas term

Basic calculus

Informal treatment of differentiation as a limit, the chain rule, Leibnitz's rule, Taylor series, informal treatment of O and o notation and l'Hôpital's rule; integration as an area, fundamental theorem of calculus, integration by substitution and parts. [3]

Informal treatment of partial derivatives, geometrical interpretation, statement (only) of symmetry of mixed partial derivatives, chain rule, implicit differentiation. Informal treatment of differentials, including exact differentials. Differentiation of an integral with respect to a parameter. [2]

First-order linear differential equations

Equations with constant coefficients: exponential growth, comparison with discrete equations, series solution; modelling examples including radioactive decay.

Equations with non-constant coefficients: solution by integrating factor. [2]

Nonlinear first-order equations

Separable equations. Exact equations. Sketching solution trajectories. Equilibrium solutions, stability by perturbation; examples, including logistic equation and chemical kinetics. Discrete equations: equilibrium solutions, stability; examples including the logistic map. [4]

Higher-order linear differential equations

Complementary function and particular integral, linear independence, Wronskian (for second-order equations), Abel's theorem. Equations with constant coefficients and examples including radioactive sequences, comparison in simple cases with difference equations, reduction of order, resonance, transients, damping. Homogeneous equations. Response to step and impulse function inputs; introduction to the notions of the Heaviside step-function and the Dirac delta-function. Series solutions including statement only of the need for the logarithmic solution. [8]

Multivariate functions: applications

Directional derivatives and the gradient vector. Statement of Taylor series for functions on \mathbb{R}^n . Local extrema of real functions, classification using the Hessian matrix. Coupled first order systems: equivalence to single higher order equations; solution by matrix methods. Non-degenerate phase portraits local to equilibrium points; stability.

Simple examples of first- and second-order partial differential equations, solution of the wave equation in the form $f(x+ct) + g(x-ct)$. [5]

Appropriate books

 D.G. Zill and M.R. Cullen *Differential Equations with Boundary Value Problems*. Brooks/Cole 2001 (£37.00 hardback)

ANALYSIS I

24 lectures, Lent term

Limits and convergence

Sequences and series in \mathbb{R} and \mathbb{C} . Sums, products and quotients. Absolute convergence; absolute convergence implies convergence. The Bolzano-Weierstrass theorem and applications (the General Principle of Convergence). Comparison and ratio tests, alternating series test. [6]

Continuity

Continuity of real- and complex-valued functions defined on subsets of \mathbb{R} and \mathbb{C} . The intermediate value theorem. A continuous function on a closed bounded interval is bounded and attains its bounds. [3]

Differentiability

Differentiability of functions from \mathbb{R} to \mathbb{R} . Derivative of sums and products. The chain rule. Derivative of the inverse function. Rolle's theorem; the mean value theorem. One-dimensional version of the inverse function theorem. Taylor's theorem from \mathbb{R} to \mathbb{R} ; Lagrange's form of the remainder. Complex differentiation. Taylor's theorem from \mathbb{C} to \mathbb{C} (statement only). [5]

Power series

Complex power series and radius of convergence. Exponential, trigonometric and hyperbolic functions, and relations between them. *Direct proof of the differentiability of a power series within its circle of convergence*. [4]

Integration

Definition and basic properties of the Riemann integral. A non-integrable function. Integrability of monotonic functions. Integrability of piecewise-continuous functions. The fundamental theorem of calculus. Differentiation of indefinite integrals. Integration by parts. The integral form of the remainder in Taylor's theorem. Improper integrals. [6]

Appropriate books

PROBABILITY

24 lectures, Lent term

Basic concepts

Classical probability, equally likely outcomes. Combinatorial analysis, permutations and combinations. Stirling's formula (asymptotics for $\log n!$ proved). [3]

Axiomatic approach

Axioms (countable case). Probability spaces. Addition theorem, inclusion-exclusion formula. Boole and Bonferroni inequalities. Independence. Binomial, Poisson and geometric distributions. Relation between Poisson and binomial distributions. Conditional probability, Bayes's formula. Examples, including Simpson's paradox. [5]

Discrete random variables

Expectation. Functions of a random variable, indicator function, variance, standard deviation. Covariance, independence of random variables. Generating functions: sums of independent random variables, random sum formula, moments.

Conditional expectation. Random walks: gambler's ruin, recurrence relations. Difference equations and their solution. Mean time to absorption. Branching processes: generating functions and extinction probability. Combinatorial applications of generating functions. [7]

Continuous random variables

Distributions and density functions. Expectations; expectation of a function of a random variable. Uniform, normal and exponential random variables. Memoryless property of exponential distribution.

Joint distributions: transformation of random variables, examples. Simulation: generating continuous random variables, independent normal random variables. Geometrical probability: Bertrand's paradox, Buffon's needle. Correlation coefficient, bivariate normal random variables. [6]

Inequalities and limits

Markov's inequality, Chebyshev's inequality. Weak law of large numbers. Convexity: Jensen's inequality, AM/GM inequality.

Moment generating functions. Statement of central limit theorem and sketch of proof. Examples, including sampling. [3]

VECTOR CALCULUS

24 lectures, Lent term

Curves in \mathbb{R}^3

Parameterised curves and arc length, tangents and normals to curves in \mathbb{R}^3 , the radius of curvature. [1]

Integration in \mathbb{R}^2 and \mathbb{R}^3

Line integrals. Surface and volume integrals: definitions, examples using Cartesian, cylindrical and spherical coordinates; change of variables. [4]

Vector operators

Directional derivatives. The gradient of a real-valued function: definition; interpretation as normal to level surfaces; examples including the use of cylindrical, spherical *and general orthogonal curvilinear* coordinates.

Divergence, curl and ∇^2 in Cartesian coordinates, examples; formulae for these operators (statement only) in cylindrical, spherical *and general orthogonal curvilinear* coordinates. Solenoidal fields, irrotational fields and conservative fields; scalar potentials. Vector derivative identities. [5]

Integration theorems

Divergence theorem, Green's theorem, Stokes's theorem, Green's second theorem: statements; informal proofs; examples; application to fluid dynamics, and to electromagnetism including statement of Maxwell's equations. [5]

Laplace's equation

Laplace's equation in \mathbb{R}^2 and \mathbb{R}^3 : uniqueness theorem and maximum principle. Solution of Poisson's equation by Gauss's method (for spherical and cylindrical symmetry) and as an integral. [4]

Cartesian tensors in \mathbb{R}^3

Tensor transformation laws, addition, multiplication, contraction, with emphasis on tensors of second rank. Isotropic second and third rank tensors. Symmetric and antisymmetric tensors. Revision of principal axes and diagonalization. Quotient theorem. Examples including inertia and conductivity. [5]

Appropriate books

DYNAMICS AND RELATIVITY

24 lectures, Lent term

[Note that this course is omitted from Option (b) of Part IA.]

Familiarity with the topics covered in the non-examinable Mechanics course is assumed.

Basic concepts

Space and time, frames of reference, Galilean transformations. Newton's laws. Dimensional analysis. Examples of forces, including gravity, friction and Lorentz. [4]

Newtonian dynamics of a single particle

Equation of motion in Cartesian and plane polar coordinates. Work, conservative forces and potential energy, motion and the shape of the potential energy function; stable equilibria and small oscillations; effect of damping.

Angular velocity, angular momentum, torque.

Orbits: the $u(\theta)$ equation; escape velocity; Kepler's laws; stability of orbits; motion in a repulsive potential (Rutherford scattering).

Rotating frames: centrifugal and coriolis forces. *Brief discussion of Foucault pendulum.* [8]

Newtonian dynamics of systems of particles

Momentum, angular momentum, energy. Motion relative to the centre of mass; the two body problem. Variable mass problems; the rocket equation. [2]

Rigid bodies

Moments of inertia, angular momentum and energy of a rigid body. Parallel axes theorem. Simple examples of motion involving both rotation and translation (e.g. rolling). [3]

Special relativity

The principle of relativity. Relativity and simultaneity. The invariant interval. Lorentz transformations in $(1+1)$ -dimensional spacetime. Time dilation and length contraction. The Minkowski metric for $(1+1)$ -dimensional spacetime.

Lorentz transformations in $(3+1)$ dimensions. 4-vectors and Lorentz invariants. Proper time. 4-velocity and 4-momentum. Conservation of 4-momentum in particle decay. Collisions. The Newtonian limit. [7]

MECHANICS (non-examinable)

10 lectures, Michaelmas term

This course is intended for students who have taken fewer than three A-level Mechanics modules (or the equivalent). The material is prerequisite for Dynamics and Relativity in the Lent term.

Lecture 1

Brief introduction

Lecture 2: Kinematics of a single particle

Position, velocity, speed, acceleration. Constant acceleration in one-dimension. Projectile motion in two-dimensions.

Lecture 3: Equilibrium of a single particle

The vector nature of forces, addition of forces, examples including gravity, tension in a string, normal reaction (Newton's third law), friction. Conditions for equilibrium.

Lecture 4: Equilibrium of a rigid body

Resultant of several forces, couple, moment of a force. Conditions for equilibrium.

Lecture 5: Dynamics of particles

Newton's second law. Examples of pulleys, motion on an inclined plane.

Lecture 6: Dynamics of particles

Further examples, including motion of a projectile with air-resistance.

Lecture 7: Energy

Definition of energy and work. Kinetic energy, potential energy of a particle in a uniform gravitational field. Conservation of energy.

Lecture 8: Momentum

Definition of momentum (as a vector), conservation of momentum, collisions, coefficient of restitution, impulse.

Lecture 9: Springs, strings and SHM

Force exerted by elastic springs and strings (Hooke's law). Oscillations of a particle attached to a spring, and of a particle hanging on a string. Simple harmonic motion of a particle for small displacement from equilibrium.

Lecture 10: Motion in a circle

Derivation of the central acceleration of a particle constrained to move on a circle. Simple pendulum; motion of a particle sliding on a cylinder.

Appropriate books

J. Hebborn and J. Littlewood *Mechanics 1, Mechanics 2 and Mechanics 3 (Edexcel)*. Heinemann, 2000 (£12.99 each paperback)

Anything similar to the above, for the other A-level examination boards

CONCEPTS IN THEORETICAL PHYSICS (non-examinable) 8 lectures, Easter term

This course is intended to give a flavour of the some of the major topics in Theoretical Physics. It will be of interest to all students.

The list of topics below is intended only to give an idea of what might be lectured; the actual content will be announced in the first lecture.

Hamilton's Principle

Principle of least action, coordinate invariance. Unification of Newton's equations with optics (Snell's law). Generalisation to Quantum Mechanics (Feynman path integral).

Fluid Dynamics

Continuum field as an approximation of many-particle systems, applications. ideas of flow, vorticity. Navier-Stokes equations. Turbulence.

Chaos and Integrability

Difference between integrable and chaotic systems, example of the spherical and double pendulums. Conserved quantities and Liouville tori. Integrable PDEs such as KdV equation.

Electrodynamics

Interaction of particles and fields, Lorentz force law. Maxwell's equations, unification of light with electricity and magnetism. Constancy of the speed of light and implications for Special Relativity.

General Relativity

Idea of curved space-time. Discussion of the Schwarzschild space-time. Geodesic motion as orbits.

Quantum Mechanics

Schrödinger equation (for two-state system), interpretation of the wave function. Bose-Einstein condensate and quantum fluids.

Particle Physics

Description of the particle zoo. Quarks, confinement. Importance of symmetries and symmetry breaking; isospin; SU(3)XSU(2)XU(1).

Cosmology

Composition and history of the universe. Friedman equation. Cosmic microwave background and density perturbations. Singularity problem. Quantum gravity.

Part IB

GENERAL ARRANGEMENTS

Structure of Part IB

Seventeen courses, including Computational Projects, are examined in Part IB. The schedules for Complex Analysis and Complex Methods cover much of the same material, but from different points of view: students may attend either (or both) sets of lectures. One course, Optimisation, can be taken in the Easter term of either the first year or the second year. Two other courses, Metric and Topological Spaces and Variational Principles, can also be taken in either Easter term, but it should be noted that some of the material in Metric and Topological Spaces will prove useful for Complex Analysis, and the material in Variational Principles forms a good background for many of the theoretical physics courses in Part IB.

The Faculty Board guidance regarding choice of courses in Part IB is as follows:

Part IB of the Mathematical Tripos provides a wide range of courses from which students should, in consultation with their Directors of Studies, make a selection based on their individual interests and preferred workload, bearing in mind that it is better to do a smaller number of courses thoroughly than to do many courses scrappily.

Computational Projects

The lectures for Computational Projects will normally be attended in the Easter term of the first year, the Computational Projects themselves being done in the Michaelmas and Lent terms of the second year (or in the summer, Christmas and Easter vacations).

No questions on the Computational Projects are set on the written examination papers, credit for examination purposes being gained by the submission of notebooks. The maximum credit obtainable is 80 marks and 4 quality marks (alphas or betas), which is roughly the same as for a 16-lecture course. Credit obtained is added to the credit gained in the written examination.

Examination

Arrangements common to all examinations of the undergraduate Mathematical Tripos are given on pages 1 and 2 of this booklet.

Each of the four papers is divided into two sections. Candidates may attempt at most four questions from Section I and at most six questions from Section II.

The number of questions set on each course varies according to the number of lectures given, as shown:

Number of lectures	Section I	Section II
24	3	4
16	2	3
12	2	2

Examination Papers

Questions on the different courses are distributed among the papers as specified in the following table. The letters S and L appearing the table denote a question in Section I and a question in Section II, respectively.

	Paper 1	Paper 2	Paper 3	Paper 4
Linear Algebra	L+S	L+S	L	L+S
Groups, Rings and Modules	L	L+S	L+S	L+S
Analysis II	L	L+S	L+S	L+S
Metric and Topological Spaces	L	S	S	L
Complex Analysis	L+S*	L*	L	S
Complex Methods			S	L
Geometry	S	L	L+S	L
Variational Principles	S	L	S	L
Methods	L	L+S	L+S	L+S
Quantum Mechanics	L	L	L+S	S
Electromagnetism	L	L+S	L	S
Fluid Dynamics	L+S	S	L	L
Numerical Analysis	L+S	L	L	S
Statistics	L+S	S	L	L
Optimization	S	S	L	L
Markov Chains	L	L	S	S

*On Paper 1 and Paper 2, Complex Analysis and Complex Methods are examined by means of common questions (each of which may contain two sub-questions, one on each course, of which candidates may attempt only one ('either/or')).

Approximate class boundaries

The merit mark, M , is defined in terms of raw mark m , number of alphas, α , and number of betas, β , by

$$M = \begin{cases} 30\alpha + 5\beta + m - 120 & \text{for } \alpha \geq 8 \\ 15\alpha + 5\beta + m & \text{for } \alpha \leq 8 \end{cases}$$

The following table shows the approximate borderlines. The first column of data shows a sufficient criterion (in terms of the primary classification criteria stated on page 1 of this booklet) for each class. The second and third columns show the merit mark, raw mark, number of alphas and number of betas of two representative candidates placed just above the borderline. The sufficient condition for each class is not prescriptive: it is just intended to be helpful for interpreting the data. Each candidate near a borderline is scrutinised individually. The data given below are relevant to one year only; borderlines may go up or down in future years.

PartIB 2010			
Class	Sufficient condition	Borderline candidates	
1	$M > 690$	691/371,13,10	672/327,15,3
2.1	$M > 460$	465/310,5,16	448/263,9,7
2.2	$M > 320$	320/215,5,6	319/224,3,10
3	$m > 150$ or $2\alpha + \beta > 8$	190/125,2,7	211/166,2,3

LINEAR ALGEBRA

24 lectures, Michaelmas term

Definition of a vector space (over \mathbb{R} or \mathbb{C}), subspaces, the space spanned by a subset. Linear independence, bases, dimension. Direct sums and complementary subspaces. [3]

Linear maps, isomorphisms. Relation between rank and nullity. The space of linear maps from U to V , representation by matrices. Change of basis. Row rank and column rank. [4]

Determinant and trace of a square matrix. Determinant of a product of two matrices and of the inverse matrix. Determinant of an endomorphism. The adjugate matrix. [3]

Eigenvalues and eigenvectors. Diagonal and triangular forms. Characteristic and minimal polynomials. Cayley-Hamilton Theorem over \mathbb{C} . Algebraic and geometric multiplicity of eigenvalues. Statement and illustration of Jordan normal form. [4]

Dual of a finite-dimensional vector space, dual bases and maps. Matrix representation, rank and determinant of dual map [2]

Bilinear forms. Matrix representation, change of basis. Symmetric forms and their link with quadratic forms. Diagonalisation of quadratic forms. Law of inertia, classification by rank and signature. Complex Hermitian forms. [4]

Inner product spaces, orthonormal sets, orthogonal projection, $V = W \oplus W^\perp$. Gram-Schmidt orthogonalisation. Adjoint. Diagonalisation of Hermitian matrices. Orthogonality of eigenvectors and properties of eigenvalues. [4]

Appropriate books

C.W. Curtis *Linear Algebra: an introductory approach*. Springer 1984 (£38.50 hardback)

P.R. Halmos *Finite-dimensional vector spaces*. Springer 1974 (£31.50 hardback)

K. Hoffman and R. Kunze *Linear Algebra*. Prentice-Hall 1971 (£72.99 hardback)

GROUPS, RINGS AND MODULES

24 lectures, Lent term

Groups

Basic concepts of group theory recalled from Algebra and Geometry. Normal subgroups, quotient groups and isomorphism theorems. Permutation groups. Groups acting on sets, permutation representations. Conjugacy classes, centralizers and normalizers. The centre of a group. Elementary properties of finite p -groups. Examples of finite linear groups and groups arising from geometry. Simplicity of A_n .

Sylow subgroups and Sylow theorems. Applications, groups of small order. [8]

Rings

Definition and examples of rings (commutative, with 1). Ideals, homomorphisms, quotient rings, isomorphism theorems. Prime and maximal ideals. Fields. The characteristic of a field. Field of fractions of an integral domain.

Factorization in rings; units, primes and irreducibles. Unique factorization in principal ideal domains, and in polynomial rings. Gauss' Lemma and Eisenstein's irreducibility criterion.

Rings $\mathbb{Z}[\alpha]$ of algebraic integers as subsets of \mathbb{C} and quotients of $\mathbb{Z}[x]$. Examples of Euclidean domains and uniqueness and non-uniqueness of factorization. Factorization in the ring of Gaussian integers; representation of integers as sums of two squares.

Ideals in polynomial rings. Hilbert basis theorem. [10]

Modules

Definitions, examples of vector spaces, abelian groups and vector spaces with an endomorphism. Submodules, homomorphisms, quotient modules and direct sums. Equivalence of matrices, canonical form. Structure of finitely generated modules over Euclidean domains, applications to abelian groups and Jordan normal form. [6]

Appropriate books

P.M. Neumann, G.A. Stoy and E.C. Thomson *Groups and Geometry*. OUP 1994 (£35.99 paperback)

M. Artin *Algebra*. Prentice Hall, 1991 (£53.99 hardback)

ANALYSIS II

24 lectures, Michaelmas term

Uniform convergence

The general principle of uniform convergence. A uniform limit of continuous functions is continuous. Uniform convergence and termwise integration and differentiation of series of real-valued functions. Local uniform convergence of power series. [3]

Uniform continuity and integration

Continuous functions on closed bounded intervals are uniformly continuous. Review of basic facts on Riemann integration (from Analysis I). Informal discussion of integration of complex-valued and \mathbb{R}^n -valued functions of one variable; proof that $\| \int_a^b f(x) dx \| \leq \int_a^b \|f(x)\| dx$. [2]

 \mathbb{R}^n as a normed space

Definition of a normed space. Examples, including the Euclidean norm on \mathbb{R}^n and the uniform norm on $\mathcal{C}[a, b]$. Lipschitz mappings and Lipschitz equivalence of norms. The Bolzano–Weierstrass theorem in \mathbb{R}^n . Completeness. Open and closed sets. Continuity for functions between normed spaces. A continuous function on a closed bounded set in \mathbb{R}^n is uniformly continuous and has closed bounded image. All norms on a finite-dimensional space are Lipschitz equivalent. [5]

Differentiation from \mathbb{R}^m to \mathbb{R}^n

Definition of derivative as a linear map; elementary properties, the chain rule. Partial derivatives; continuous partial derivatives imply differentiability. Higher-order derivatives; symmetry of mixed partial derivatives (assumed continuous). Taylor’s theorem. The mean value inequality. Path-connectedness for subsets of \mathbb{R}^n ; a function having zero derivative on a path-connected open subset is constant. [6]

Metric spaces

Definition and examples. *Metrics used in Geometry*. Limits, continuity, balls, neighbourhoods, open and closed sets. [4]

The Contraction Mapping Theorem

The contraction mapping theorem. Applications including the inverse function theorem (proof of continuity of inverse function, statement of differentiability). Picard’s solution of differential equations. [4]

Appropriate books

METRIC AND TOPOLOGICAL SPACES

12 lectures, Easter term

Metrics

Definition and examples. Limits and continuity. Open sets and neighbourhoods. Characterizing limits and continuity using neighbourhoods and open sets. [3]

Topology

Definition of a topology. Metric topologies. Further examples. Neighbourhoods, closed sets, convergence and continuity. Hausdorff spaces. Homeomorphisms. Topological and non-topological properties. Completeness. Subspace, quotient and product topologies. [3]

Connectedness

Definition using open sets and integer-valued functions. Examples, including intervals. Components. The continuous image of a connected space is connected. Path-connectedness. Path-connected spaces are connected but not conversely. Connected open sets in Euclidean space are path-connected. [3]

Compactness

Definition using open covers. Examples: finite sets and $[0, 1]$. Closed subsets of compact spaces are compact. Compact subsets of a Hausdorff space must be closed. The compact subsets of the real line. Continuous images of compact sets are compact. Quotient spaces. Continuous real-valued functions on a compact space are bounded and attain their bounds. The product of two compact spaces is compact. The compact subsets of Euclidean space. Sequential compactness. [3]

Appropriate books

A.J. White *Real analysis: an introduction*. Addison–Wesley 1968 (out of print)

B. Mendelson *Introduction to Topology*. Dover, 1990 (£5.27 paperback)

COMPLEX ANALYSIS

16 lectures, Lent term

Analytic functions

Complex differentiation and the Cauchy-Riemann equations. Examples. Conformal mappings. Informal discussion of branch points, examples of $\log z$ and z^c . [3]

Contour integration and Cauchy's theorem

Contour integration (for piecewise continuously differentiable curves). Statement and proof of Cauchy's theorem for star domains. Cauchy's integral formula, maximum modulus theorem, Liouville's theorem, fundamental theorem of algebra. Morera's theorem. [5]

Expansions and singularities

Uniform convergence of analytic functions; local uniform convergence. Differentiability of a power series. Taylor and Laurent expansions. Principle of isolated zeros. Residue at an isolated singularity. Classification of isolated singularities. [4]

The residue theorem

Winding numbers. Residue theorem. Jordan's lemma. Evaluation of definite integrals by contour integration. Rouché's theorem, principle of the argument. Open mapping theorem. [4]

Appropriate books

I. Stewart and D. Tall *Complex Analysis*. Cambridge University Press 1983 (£27.00 paperback)

COMPLEX METHODS

16 lectures, Lent term

Analytic functions

Definition of an analytic function. Cauchy-Riemann equations. Analytic functions as conformal mappings; examples. Application to the solutions of Laplace's equation in various domains. Discussion of $\log z$ and z^a . [5]

Contour integration and Cauchy's Theorem

[Proofs of theorems in this section will not be examined in this course.]

Contours, contour integrals. Cauchy's theorem and Cauchy's integral formula. Taylor and Laurent series. Zeros, poles and essential singularities. [3]

Residue calculus

Residue theorem, calculus of residues. Jordan's lemma. Evaluation of definite integrals by contour integration. [4]

Fourier and Laplace transforms

Laplace transform: definition and basic properties; inversion theorem (proof not required); convolution theorem. Examples of inversion of Fourier and Laplace transforms by contour integration. Applications to differential equations. [4]

Appropriate books

M.J. Ablowitz and A.S. Fokas *Complex variables: introduction and applications*. CUP 2003 (£65.00)

GEOMETRY

16 lectures, Lent term

Parts of Analysis II will be found useful for this course.

Groups of rigid motions of Euclidean space. Rotation and reflection groups in two and three dimensions. Lengths of curves. [2]

Spherical geometry: spherical lines, spherical triangles and the Gauss-Bonnet theorem. Stereographic projection and Möbius transformations. [3]

Triangulations of the sphere and the torus, Euler number. [1]

Riemannian metrics on open subsets of the plane. The hyperbolic plane. Poincaré models and their metrics. The isometry group. Hyperbolic triangles and the Gauss-Bonnet theorem. The hyperboloid model. [4]

Embedded surfaces in \mathbb{R}^3 . The first fundamental form. Length and area. Examples. [1]

Length and energy. Geodesics for general Riemannian metrics as stationary points of the energy. First variation of the energy and geodesics as solutions of the corresponding Euler-Lagrange equations. [2]

Geodesic polar coordinates (informal proof of existence). Surfaces of revolution. [2]

The second fundamental form and Gaussian curvature. For metrics of the form $du^2 + G(u, v)dv^2$, expression of the curvature as $\sqrt{G_{uu}}/\sqrt{G}$. Abstract smooth surfaces and isometries. Euler numbers and statement of Gauss-Bonnet theorem, examples and applications. [3]

Appropriate books

VARIATIONAL PRINCIPLES

12 lectures, Easter Term

Stationary points for functions on \mathbb{R}^n . Necessary and sufficient conditions for minima and maxima. Importance of convexity. Variational problems with constraints; method of Lagrange multipliers. The Legendre Transform; need for convexity to ensure invertibility; illustrations from thermodynamics. [4]

The idea of a functional and a functional derivative. First variation for functionals, Euler-Lagrange equations, for both ordinary and partial differential equations. Use of Lagrange multipliers and multiplier functions. [3]

Fermat's principle; geodesics; least action principles, Lagrange's and Hamilton's equations for particles and fields. Noether theorems and first integrals, including two forms of Noether's theorem for ordinary differential equations (energy and momentum, for example). Interpretation in terms of conservation laws. [3]

Second variation for functionals; associated eigenvalue problem. [2]

Appropriate books

D.S. Lemons *Perfect Form*. Princeton University Press 1997 (£13.16 paperback)

C. Lanczos *The Variational Principles of Mechanics*. Dover 1986 (£9.47 paperback)

S. Hildebrandt and A. Tromba *Mathematics and Optimal Form*. Scientific American Library 1985 (£16.66 paperback)

METHODS

24 lectures, Michaelmas term

Self-adjoint ODEs

Periodic functions. Fourier series: definition and simple properties; Parseval's theorem. Equations of second order. Self-adjoint differential operators. The Sturm-Liouville equation; eigenfunctions and eigenvalues; reality of eigenvalues and orthogonality of eigenfunctions; eigenfunction expansions (Fourier series as prototype), approximation in mean square, statement of completeness. [5]

PDEs on bounded domains: separation of variables

Physical basis of Laplace's equation, the wave equation and the diffusion equation. General method of separation of variables in Cartesian, cylindrical and spherical coordinates. Legendre's equation: derivation, solutions including explicit forms of P_0 , P_1 and P_2 , orthogonality. Bessel's equation of integer order as an example of a self-adjoint eigenvalue problem with non-trivial weight.

Examples including potentials on rectangular and circular domains and on a spherical domain (axisymmetric case only), waves on a finite string and heat flow down a semi-infinite rod. [5]

Inhomogeneous ODEs: Green's functions

Properties of the Dirac delta function. Initial value problems and forced problems with two fixed end points; solution using Green's functions. Eigenfunction expansions of the delta function and Green's functions. [4]

Fourier transforms

Fourier transforms: definition and simple properties; inversion and convolution theorems. The discrete Fourier transform. Examples of application to linear systems. Relationship of transfer function to Green's function for initial value problems. [4]

PDEs on unbounded domains

Classification of PDEs in two independent variables. Well posedness. Solution by the method of characteristics. Green's functions for PDEs in 1, 2 and 3 independent variables; fundamental solutions of the wave equation, Laplace's equation and the diffusion equation. The method of images. Application to the forced wave equation, Poisson's equation and forced diffusion equation. Transient solutions of diffusion problems: the error function.

QUANTUM MECHANICS

16 lectures, Michaelmas term

Physical background

Photoelectric effect. Electrons in atoms and line spectra. Particle diffraction. [1]

Schrödinger equation and solutions

De Broglie waves. Schrödinger equation. Superposition principle. Probability interpretation, density and current. [2]

Stationary states. Free particle, Gaussian wave packet. Motion in 1-dimensional potentials, parity. Potential step, square well and barrier. Harmonic oscillator. [4]

Observables and expectation values

Position and momentum operators and expectation values. Canonical commutation relations. Uncertainty principle. [2]

Observables and Hermitian operators. Eigenvalues and eigenfunctions. Formula for expectation value. [2]

Hydrogen atom

Spherically symmetric wave functions for spherical well and hydrogen atom.

Orbital angular momentum operators. General solution of hydrogen atom. [5]

Appropriate books

ELECTROMAGNETISM

16 lectures, Lent term

Introduction to Maxwell's equations

Electric and magnetic fields, charge, current. Maxwell's equations and the Lorentz force. Charge conservation. Integral form of Maxwell's equations and their interpretation. Scalar and vector potentials; gauge transformations. [3]

Electrostatics

Point charges and the inverse square law, line and surface charges, dipoles. Electrostatic energy. Gauss's law applied to spherically symmetric and cylindrically symmetric charge distributions. Plane parallel capacitor. [3]

Steady currents

Ohm's law, flow of steady currents. Magnetic fields due to steady currents, simple examples treated by means of Ampère's equation. Vector potential due to a general current distribution, the Biot–Savart law. Magnetic dipoles. Lorentz force on steady current distributions and force between current-carrying wires. [4]

Electromagnetic induction

Faraday's law of induction for fixed and moving circuits; simple dynamo. [2]

Electromagnetic waves

Electromagnetic energy and Poynting vector. Plane electromagnetic waves in vacuum, polarisation. Reflection at a plane conducting surface. [4]

Appropriate books

FLUID DYNAMICS

16 lectures, Lent term

Kinematics

Continuum fields: density and velocity. Flow visualisation: particle paths, streamlines and dye streak-lines. Material time derivative. Conservation of mass and the kinematic boundary condition at a moving boundary. Incompressibility and streamfunctions. [3]

Dynamics

Surface and volume forces; pressure in frictionless fluids. The Euler momentum equation. Applications of the momentum integral.

Bernoulli's theorem for steady flows with potential forces; applications.

Vorticity, vorticity equation, vortex line stretching, irrotational flow remains irrotational, *Kelvin's circulation theorem*. [4]

Potential flows

Velocity potential; Laplace's equation. Examples of solutions in spherical and cylindrical geometry by separation of variables.

Expression for pressure in time-dependent potential flows with potential forces; applications. Spherical bubbles; small oscillations, collapse of a void. Translating sphere and inertial reaction to acceleration, *effects of friction*. Fluid kinetic energy for translating sphere.

Lift on an arbitrary 2D aerofoil with circulation, *generation of circulation*. [6]

Interfacial flows

Governing equations and boundary conditions. Linear water waves: dispersion relation, deep and shallow water, particle paths, standing waves in a container. Rayleigh–Taylor instability.

River flows: over a bump, out of a lake over a broad weir, *hydraulic jumps*. [3]

NUMERICAL ANALYSIS

16 lectures, Lent term

Polynomial approximation

Interpolation by polynomials. Divided differences of functions and relations to derivatives. Orthogonal polynomials and their recurrence relations. Least squares approximation by polynomials. Gaussian quadrature formulae. Peano kernel theorem and applications. [6]

Computation of ordinary differential equations

Euler's method and proof of convergence. Multistep methods, including order, the root condition and the concept of convergence. Runge-Kutta schemes. Stiff equations and A-stability.

Systems of equations and least squares calculations

LU triangular factorization of matrices. Relation to Gaussian elimination. Column pivoting. Factorizations of symmetric and band matrices. The Newton-Raphson method for systems of non-linear algebraic equations. QR factorization of rectangular matrices by Gram-Schmidt, Givens and Householder techniques. Application to linear least squares calculations. [6]

Appropriate books

M.J.D. Powell *Approximation Theory and Methods*. Cambridge University Press 1981 (£25.95 paperback)

STATISTICS

16 lectures, Lent term

Estimation

Review of distribution and density functions, parametric families. Examples: binomial, Poisson, gamma. Sufficiency, minimal sufficiency, the Rao-Blackwell theorem. Maximum likelihood estimation. Confidence intervals. Use of prior distributions and Bayesian inference. [5]

Hypothesis testing

Simple examples of hypothesis testing, null and alternative hypothesis, critical region, size, power, type I and type II errors, Neyman-Pearson lemma. Significance level of outcome. Uniformly most powerful tests. Likelihood ratio, and use of generalised likelihood ratio to construct test statistics for composite hypotheses. Examples, including t -tests and F -tests. Relationship with confidence intervals. Goodness-of-fit tests and contingency tables. [4]

Linear models

Derivation and joint distribution of maximum likelihood estimators, least squares, Gauss-Markov theorem. Testing hypotheses, geometric interpretation. Examples, including simple linear regression and one-way analysis of variance. *Use of software*. [7]

Appropriate books

D.A. Berry and B.W. Lindgren *Statistics, Theory and Methods*. Wadsworth 1995 ()

G. Casella and J.O. Berger *Statistical Inference*. Duxbury 2001 ()

M.H. DeGroot and M.J. Schervish *Probability and Statistics*. Pearson Education 2001 ()

MARKOV CHAINS

12 lectures, Michaelmas term

Discrete-time chains

Definition and basic properties, the transition matrix. Calculation of n -step transition probabilities. Communicating classes, closed classes, absorption, irreducibility. Calculation of hitting probabilities and mean hitting times; survival probability for birth and death chains. Stopping times and statement of the strong Markov property. [5]

Recurrence and transience; equivalence of transience and summability of n -step transition probabilities; equivalence of recurrence and certainty of return. Recurrence as a class property, relation with closed classes. Simple random walks in dimensions one, two and three. [3]

Invariant distributions, statement of existence and uniqueness up to constant multiples. Mean return time, positive recurrence; equivalence of positive recurrence and the existence of an invariant distribution. Convergence to equilibrium for irreducible, positive recurrent, aperiodic chains *and proof by coupling*. Long-run proportion of time spent in given state. [3]

Time reversal, detailed balance, reversibility; random walk on a graph. [1]

Appropriate books

G.R. Grimmett and D.R. Stirzaker *Probability and Random Processes*. OUP 2001 (£29.95 paperback)

J.R. Norris *Markov Chains*. Cambridge University Press 1997 (£20.95 paperback)

Y. Suhov and M Kelbert *Probability and Statistics by Example, vol II*. cambridge University Press, date (£29.95, paperback)

OPTIMISATION

12 lectures, Easter term

Lagrangian methods

General formulation of constrained problems; the Lagrangian sufficiency theorem. Interpretation of Lagrange multipliers as shadow prices. Examples. [2]

Linear programming in the nondegenerate case

Convexity of feasible region; sufficiency of extreme points. Standardization of problems, slack variables, equivalence of extreme points and basic solutions. The primal simplex algorithm, artificial variables, the two-phase method. Practical use of the algorithm; the tableau. Examples. The dual linear problem, duality theorem in a standardized case, complementary slackness, dual variables and their interpretation as shadow prices. Relationship of the primal simplex algorithm to dual problem. Two person zero-sum games. [6]

Network problems

The Ford-Fulkerson algorithm and the max-flow min-cut theorems in the rational case. Network flows with costs, the transportation algorithm, relationship of dual variables with nodes. Examples. Conditions for optimality in more general networks; *the simplex-on-a-graph algorithm*. [3]

Practice and applications

Efficiency of algorithms. The formulation of simple practical and combinatorial problems as linear programming or network problems. [1]

Appropriate books

† M.S. Bazaraa, J.J. Jarvis and H.D. Sherali *Linear Programming and Network Flows*. Wiley 1990 (£80.95 hardback).

† D. Luenberger *Linear and Nonlinear Programming*. Addison-Wesley 1984 (out of print).
R.J. Vanderbei *Linear programming: foundations and extensions*. Kluwer 2001 (£61.50 hardback)

COMPUTATIONAL PROJECTS**8 lectures, plus project work Easter term**

The lectures are given in the Easter Full Term of the Part IA year and are accompanied by introductory practical classes. Students register for these classes: arrangements will be announced during the lectures. The Faculty publishes a projects booklet by the end of July preceding the Part IB year (i.e., shortly after the end of Term 3). This contains details of the projects and information about course administration. The booklet is available on the Faculty website at <http://www.maths.cam.ac.uk/undergrad/catam/>. Full credit may be obtained from the submission of the two core projects and a further two projects. Once the booklet is available, these projects may be undertaken at any time up to the submission deadlines, which are near the start of the Full Lent Term in the IB year for the two core projects and near the start of the Full Easter Term in the IB year for the two additional projects.

CONCEPTS IN THEORETICAL PHYSICS (non-examinable) 8 lectures, Easter term

This course is intended to give a flavour of the some of the major topics in Theoretical Physics. It will be of interest to all students.

The list of topics below is intended only to give an idea of what might be lectured; the actual content will be announced in the first lecture.

Hamilton's Principle

Principle of least action, coordinate invariance. Unification of Newton's equations with optics (Snell's law). Generalisation to Quantum Mechanics (Feynman path integral).

Fluid Dynamics

Continuum field as an approximation of many-particle systems, applications. ideas of flow, vorticity. Navier-Stokes equations. Turbulence.

Chaos and Integrability

Difference between integrable and chaotic systems, example of the spherical and double pendulums. Conserved quantities and Liouville tori. Integrable PDEs such as KdV equation.

Electrodynamics

Interaction of particles and fields, Lorentz force law. Maxwell's equations, unification of light with electricity and magnetism. Constancy of the speed of light and implications for Special Relativity.

General Relativity

Idea of curved space-time. Discussion of the Schwarzschild space-time. Geodesic motion as orbits.

Quantum Mechanics

Schrödinger equation (for two-state system), interpretation of the wave function. Bose-Einstein condensate and quantum fluids.

Particle Physics

Description of the particle zoo. Quarks, confinement. Importance of symmetries and symmetry breaking; isospin; $SU(3) \times SU(2) \times U(1)$.

Cosmology

Composition and history of the universe. Friedman equation. Cosmic microwave background and density perturbations. Singularity problem. Quantum gravity.

Part II

GENERAL ARRANGEMENTS

Structure of Part II

There are two types of lecture courses in Part II: C courses and D courses. C courses are intended to be straightforward and accessible, and of general interest, whereas D courses are intended to be more demanding. The Faculty Board recommend that students who have not obtained at least a good second class in Part IB should include a significant number of type C courses amongst those they choose.

There are 10 C courses and 26 D courses. All C courses are 24 lectures; of the D courses, 19 are 24 lectures and 7 are 16 lectures. The complete list of courses is as follows (the asterisk denotes a 16-lecture course):

C courses	D courses	
Number Theory	Logic and Set Theory	*Optimisation and Control
Topics in Analysis	Graph Theory	Stochastic Financial Models
Geometry and Groups	Galois Theory	Partial Differential Equations
Coding and Cryptography	Representation Theory	*Asymptotic Methods
Statistical Modelling	*Number Fields	*Integrable Systems
Mathematical Biology	Algebraic Topology	Principles of Quantum Mechanics
Dynamical Systems	Linear Analysis	Applications of Quantum Mechanics
Further Complex Methods	*Riemann Surfaces	Statistical Physics
Classical Dynamics	Algebraic Geometry	*Electrodynamics
Cosmology	Differential Geometry	*General Relativity
	Probability and Measure	Fluid Dynamics
	Applied Probability	Waves
	Principles of Statistics	Numerical Analysis

Computational Projects

In addition to the lectured courses, there is a Computational Projects course. No questions on the Computational Projects are set on the written examination papers, credit for examination purposes being gained by the submission of notebooks. The maximum credit obtainable is 60 marks and 3 quality marks (alphas or betas), which is the same as that available for a 16-lecture course. Credit obtained on the Computational Projects is added to that gained in the written examination.

Examinations

Arrangements common to all examinations of the undergraduate Mathematical Tripos are given on pages 1 and 2 of this booklet.

There are no restrictions on the number or type of courses that may be presented for examination. The Faculty Board has recommended to the examiners that no distinction be made, for classification purposes, between quality marks obtained on the Section II questions for C course questions and those obtained for D course questions.

Candidates may answer no more than six questions in Section I on each paper; there is no restriction on the number of questions in Section II that may be answered.

The number of questions set on each course is determined by the type and length of the course, as shown in the table at the top of the next page.

	Section I	Section II
C course (24 lectures)	4	2
D course, 24 lectures	—	4
D course, 16 lectures	—	3

In Section I of each paper, there are 10 questions, one on each C course.

In Section II of each paper, there are 5 questions on C courses, one question on each of the 19 24-lecture D courses and either one question or no questions on each of the 7 16-lecture D courses, giving a total of 29 or 30 questions on each paper.

The distribution in Section II of the C course questions and the 16-lecture D course questions is shown in the following table.

	P1	P2	P3	P4		P1	P2	P3	P4
C courses					16-lecture D courses				
Number Theory			*	*	Number Fields	*	*		*
Topics in Analysis		*	*		Riemann Surfaces	*	*	*	
Geometry and Groups	*			*	Optimization and Control		*	*	*
Coding and Cryptography	*	*			Asymptotic Methods	*		*	*
Statistical Modelling	*			*	Integrable Systems	*	*	*	
Mathematical Biology		*	*		Electrodynamics	*	*	*	*
Dynamical Systems			*	*	General Relativity	*	*		*
Further Complex Methods	*	*							
Classical Dynamics		*		*					
Cosmology	*		*						

Approximate class boundaries

The merit mark, M , is defined in terms of raw mark m , number of alphas, α , and number of betas, β , by

$$M = \begin{cases} 30\alpha + 5\beta + m - 120 & \text{for } \alpha \geq 8 \\ 15\alpha + 5\beta + m & \text{for } \alpha \leq 8 \end{cases}$$

The following table shows the approximate borderlines. The first column of data shows a sufficient criterion (in terms of the primary classification criteria stated on page 1 of this booklet) for each class. The second and third columns show the merit mark, raw mark, number of alphas and number of betas of two representative candidates placed just above the borderline. The sufficient condition for each class is not prescriptive: it is just intended to be helpful for interpreting the data. Each candidate near a borderline is scrutinised individually. The data given below are relevant to one year only; borderlines may go up or down in future years.

PartII 2010		
Class	Sufficient condition	Borderline candidates
1	$M > 625$	612/292,14,4 634/364,11,12
2.1	$M > 365$	367/222,7,8 371/241,5,11
2.2	$M > 240$	244/179,2,7 252/177,2,9
3	$m > 130$ or $2\alpha + \beta > 10$	196/136,2,6 209/149,3,3

NUMBER THEORY (C)

24 lectures, Michaelmas term

Review from Part IA Numbers and Sets: Euclid's Algorithm, prime numbers, fundamental theorem of arithmetic. Congruences. The theorems of Fermat and Euler. [2]
 Chinese remainder theorem. Lagrange's theorem. Primitive roots to an odd prime power modulus. [3]
 The mod- p field, quadratic residues and non-residues, Legendre's symbol. Euler's criterion. Gauss' lemma, quadratic reciprocity. [2]
 Proof of the law of quadratic reciprocity. The Jacobi symbol. [1]
 Binary quadratic forms. Discriminants. Standard form. Representation of primes. [5]
 Distribution of the primes. Divergence of $\sum_p p^{-1}$. The Riemann zeta-function and Dirichlet series. Statement of the prime number theorem and of Dirichlet's theorem on primes in an arithmetic progression. Legendre's formula. Bertrand's postulate. [4]
 Continued fractions. Pell's equation. [3]
 Primality testing. Fermat, Euler and strong pseudo-primes. [2]
 Factorization. Fermat factorization, factor bases, the continued-fraction method. Pollard's method. [2]

Appropriate books

A. Baker *A Concise Introduction to the Theory of Numbers*. Cambridge University Press 1984 (£14.95 paperback)
 G.H. Hardy and E.M. Wright *An Introduction to the Theory of Numbers*. Oxford University Press 1979 (£18.50 paperback)
 N. Koblitz *A Course in Number Theory and Cryptography*. Springer 1994 (£22.50 hardback)
 T. Nagell *Introduction to Number Theory*. OUP 1981 (£16.00 hardback)
 I. Niven, H.S. Zuckerman and H.L. Montgomery *An Introduction to the Theory of Numbers*. Wiley 1991 (£71.95 hardback)
 H. Riesel *Prime Numbers and Computer Methods for Factorization*. Birkhauser 1994 (£69.50 hardback)

TOPICS IN ANALYSIS (C)

24 lectures, Michaelmas term

Analysis courses from IB will be helpful, but it is intended to introduce and develop concepts of analysis as required.

Discussion of metric spaces; compactness and completeness. Brouwer's fixed point theorem. Proof(s) in two dimensions. Equivalent formulations, and applications. The degree of a map. The fundamental theorem of algebra, the Argument Principle for continuous functions, and a topological version of Rouché's Theorem. [6]
 The Weierstrass Approximation Theorem. Chebychev polynomials and best uniform approximation. Gaussian quadrature converges for all continuous functions. Review of basic properties of analytic functions. Runge's Theorem on the polynomial approximation of analytic functions. [8]
 Liouville's proof of the existence of transcendentals. The irrationality of e and π . The continued fraction expansion of real numbers; the continued fraction expansion of e . [4]
 Review of countability, topological spaces, and the properties of compact Hausdorff spaces. The Baire category theorem for a complete metric space. Applications. [6]

Appropriate books

A.F. Beardon *Complex Analysis: the Argument Principle in Analysis and Topology*. John Wiley & Sons, 1979 (Out of print)
 E.W. Cheney *Introduction to Approximation Theory*. AMS, 1999 (£21.00 hardback)

 T. Sheil-Small *Complex Polynomials*. Cambridge University Press, 2002 (£70.00 hardback)

GEOMETRY AND GROUPS (C)**24 lectures, Lent term**

Analysis II and Geometry are useful, but any concepts required from these courses will be introduced and developed in the course.

A brief discussion of the Platonic solids. The identification of the symmetry groups of the Platonic solids with the finite subgroups of $SO(3)$. [4]

The upper half-plane and disc models of the hyperbolic plane. The hyperbolic metric; a comparison of the growth of circumference and area in Euclidean and hyperbolic geometry. The identification of isometries of the upper half-plane with real Möbius maps, and the classification of isometries of the hyperbolic plane. The Modular group $SL(2, \mathbb{Z})$ and its action on the upper half-plane. The tessellation of hyperbolic plane by ideal triangles. [6]

Group actions: discrete groups, properly discontinuous group actions. Quotients by group actions and fundamental domains. Brief discussion of Escher's work as illustrations of tessellations of the hyperbolic plane, and of Euclidean crystallographic groups. [5]

Examples of fractals, including Cantor's middle-third set and similar constructions. Cantor sets, and non-rectifiable curves, as limit sets of discrete Möbius groups. Fractals obtained dynamically. The Hausdorff dimension of a set, computations of examples. [5]

The upper half-space of \mathbb{R}^3 as hyperbolic three-space; the identification of the group of Möbius maps as the isometries of hyperbolic three-space, and of the finite groups of Möbius maps with the the finite subgroups of $SO(3)$. *Discussion of Euclidean crystallographic groups in higher dimensions.* [4]

Appropriate books

A.F. Beardon *The geometry of discrete groups*. Springer-Verlag, Graduate Texts No. 91, 1983 (£?)

K. Falconer *Fractal Geometry*. John Wiley & Sons, 1990 (£85.00 Hardback)

R.C. Lyndon *Groups and Geometry, LMS Lecture Notes 101*. Cambridge University Press, 1985 (£?)

V.V. Nikulin and I.R. Shafarevich *Geometries and Groups*. Springer-Verlag, 1987 (£?)

CODING AND CRYPTOGRAPHY (C)**24 lectures, Lent term**

Part IB Linear Algebra is useful and Part IB Groups, Rings and Modules is very useful.

Introduction to communication channels, coding and channel capacity. [1]

Data compression; decipherability. Kraft's inequality. Huffman and Shannon-Fano coding. Shannon's noiseless coding theorem. [2]

Applications to gambling and the stock market. [1]

Codes, error detection and correction, Hamming distance. Examples: simple parity, repetition, Hamming's original [7,16] code. Maximum likelihood decoding. The Hamming and V-G-S bounds. Entropy. [4]

Information rate of a Bernoulli source. Capacity of a memoryless binary symmetric channel; Shannon's noisy coding theorem for such channels. [3]

Linear codes, weight, generator matrices, parity checks. Syndrome decoding. Dual codes. Examples: Hamming, Reed-Muller. [2]

Cyclic codes. Discussion without proofs of the abstract algebra (finite fields, polynomial rings and ideals) required. Generator and check polynomials. BCH codes. Error-locator polynomial and decoding. Recurrence (shift-register) sequences. Berlekamp-Massey algorithm. [4]

Introduction to cryptography. Unicity distance, one-time pad. Shift-register based pseudo-random sequences. Linear complexity. Simple cipher machines. [1]

Secret sharing via simultaneous linear equations. Public-key cryptography. Secrecy and authentication. The RSA system. The discrete logarithm problem and el Gamal (DSA) signatures. Bit commitment and coin tossing. [4]

Discussion (without proofs) of quantum cryptography and the BB84 protocol. [2]

Appropriate books

† G.M. Goldie and R.G.E. Pinch *Communication Theory*. Cambridge University Press 1991 (£25.95 paperback).

D. Welsh *Codes and Cryptography*. OUP 1988 (£25.95 paperback)

T.M. Cover and J.A. Thomas *Elements of Information Theory*. Wiley 1991 (£58.50 hardback)

W. Trappe and L.C. Washington *Introduction to Cryptography with Coding Theory*. Prentice Hall, 2002 (£45.99)

STATISTICAL MODELLING (C)**24 lectures, Lent term**

Part IB Statistics is essential. About two thirds of this course will be lectures, with the remaining hours as practical classes, using R in the CATAM system. R may be downloaded at no cost via <http://cran.r-project.org>

Introduction to the statistical package R

The use of R for graphical summaries of data, e.g. histograms, and for classical tests such as t -tests and F -tests. [2]

Review of basic inferential techniques

Asymptotic distribution of the maximum likelihood estimator. Approximate confidence intervals and hypothesis tests. Wilks' theorem. Posterior distributions and credible intervals. [3]

Linear models

Maximum likelihood, least squares, Bayesian posterior estimators and projection matrices. Prediction. Multiple linear regression, analysis of variance, transformations of variables including Box-Cox and model selection. Orthogonality of sets of parameters. Factors, interactions and their interpretation. Leverages, residuals, qq-plots, multiple R^2 and Cook's distances. [5]

Exponential dispersion families and generalised linear models (glm)

Review of exponential families and mean-variance relationship. Dispersion parameter and generalised linear models. Canonical link function. Iterative solution of likelihood equations. Regression for binomial data; use of logit and other link functions. Poisson regression models, and their surrogate use for multinomial data. Application to 2- and 3-way contingency tables. Hypothesis tests and model comparison, including deviance and Akaike Information Criteria. [6]

Examples in R

Linear and generalised linear models. Inference, model selection and criticism. [6]

Appropriate books

A.J.Dobson *An Introduction to Generalized Linear Models*. Chapman and Hall 2002 (£17.49 Paperback)

J.Faraway *Practical Regression and Anova in R*. <http://cran.r-project.org/doc/contrib/Faraway-PRA.pdf> (2002)

A.C. Davison *Statistical Models*. CUP 2008 ()

MATHEMATICAL BIOLOGY (C)**24 lectures, Lent term**

Part II Dynamical Systems is very helpful for this course.

Systems without spatial structure: deterministic systems

Examples: population dynamics, epidemiology, chemical reactions, physiological systems.

Continuous and discrete population dynamics governed by deterministic ordinary differential equations or difference equations. Single population models: the logistic model and bifurcation to chaos; systems with time delay; age-structured populations. Two-species models: predator-prey interactions, competition, enzyme kinetics, infectious diseases. Phase-plane analysis, null-clines and stability of equilibrium. Systems exhibiting nonlinear oscillations: limit cycles; excitable systems. [9]

Stochastic systems

Discrete stochastic models of birth and death processes. Master equations and Fokker-Planck equations. The continuum limit and the importance of fluctuations. Simple random walk and derivation of the diffusion equation. [5]

Systems without spatial structure: diffusion and reaction-diffusion systems

The general transport equation. Fundamental solutions for steady and unsteady diffusion. Models with density-dependent diffusion. Fischer-Kolmogorov equation: propagation of reaction-diffusion waves. Chemotaxis and the growth of chemotactic instability. General conditions for diffusion-driven (Turing) instability: linear stability analysis and evolution of spatial pattern. [7]

Neural computation

Hodgkin-Huxley model of action-potential propagation. Unsupervised and supervised learning. [3]

Appropriate books

L. Edelstein-Keshet *Mathematical Models in Biology*. SIAM reprint, 2005 ()

J.D. Murray *Mathematical Biology (3rd edition), especially volume 1*. Springer, 2002 (£42.35 hardback)

C.W. Gardiner *Handbook of Stochastic Methods (2nd edition)*. Springer, 2004 (£61.50 paperback)

J. Hertz, A. Krogh and R.g. Palmer *Introduction to the Theory of Neural Networks*. Addison-Wesley, 1991 (£30.98, paperback)

DYNAMICAL SYSTEMS (C)

24 lectures, Michaelmas term

General introduction

The notion of a dynamical system and examples of simple phase portraits. Relationship between continuous and discrete systems. Reduction to autonomous systems. Initial value problems, uniqueness, finite-time blowup, examples. Flows, orbits, invariant sets, limit sets and topological equivalence.

[3]

Fixed points of flows

Linearization. Classification of fixed points in \mathbb{R}^2 , Hamiltonian case. Effects of nonlinearity; hyperbolic and non-hyperbolic cases; Stable-manifold theorem (statement only), stable and unstable manifolds in \mathbb{R}^2 . Phase-plane sketching.

[3]

Stability

Lyapunov, quasi-asymptotic and asymptotic stability of invariant sets. Lyapunov and bounding functions. Lyapunov's 1st theorem; La Salle's invariance principle. Local and global stability.

[2]

Periodic orbits in \mathbb{R}^2

The Poincaré index; Dulac's criterion; the Poincaré–Bendixson theorem (*and proof*). Nearly Hamiltonian flows.

Stability of periodic orbits; Floquet multipliers. Examples; van der Pol oscillator.

[5]

Bifurcations in flows and maps

Non-hyperbolicity and structural stability. Local bifurcations of fixed points: saddle-node, transcritical, pitchfork and Andronov-Hopf bifurcations. Construction of centre manifold and normal forms. Examples. Effects of symmetry and symmetry breaking. *Bifurcations of periodic orbits.* Fixed points and periodic points for maps. Bifurcations in 1-dimensional maps: saddle-node, period-doubling, transcritical and pitchfork bifurcations. The logistic map.

[5]

Chaos

Sensitive dependence on initial conditions, topological transitivity. Maps of the interval, the sawtooth map, horseshoes, symbolic dynamics. Period three implies chaos, the occurrence of N -cycles, Sharkovskiy's theorem (statement only). The tent map. Unimodal maps and Feigenbaum's constant.

[6]

Appropriate books

D.W. Jordan and P. Smith *Nonlinear Ordinary Differential Equations*. OUP 1999 (£24.50 paperback)

S. Wiggins *Introduction to Applied Nonlinear Dynamical Systems and Chaos*. Springer 1990 (£34.00 hardback)

J. Guckenheimer and P. Holmes *Nonlinear Oscillations, Dynamical Systems, and Bifurcations of Vector Fields*. Springer, second edition 1986 (£37.50 hardback)

FURTHER COMPLEX METHODS (C)

24 lectures, Lent term

Complex Methods (or Complex Analysis) is essential.

Complex variable

Revision of complex variable. Analyticity of a function defined by an integral (statement and discussion only). Analytic and meromorphic continuation.

Cauchy principal value of finite and infinite range improper integrals. The Hilbert transform. Kramers-Kronig relations.

Multivalued functions: definitions, branch points and cuts, integration; examples, including inverse trigonometric functions as integrals and elliptic integrals.

[8]

Special functions

Gamma function: Euler integral definition; brief discussion of product formulae; Hankel representation; reflection formula; discussion of uniqueness (e.g. Wielandt's theorem). Beta function: Euler integral definition; relation to the gamma function. Riemann zeta function: definition as a sum; integral representations; functional equation; *discussion of zeros and relation to $\pi(x)$ and the distribution of prime numbers*.

[6]

Differential equations by transform methods

Solution of differential equations by integral representation; Airy equation as an example. Solution of partial differential equations by transforms; the wave equation as an example. Causality. Nyquist stability criterion.

[4]

Second order ordinary differential equations in the complex plane

Classification of singularities, exponents at a regular singular point. Nature of the solution near an isolated singularity by analytic continuation. Fuchsian differential equations. The Riemann P-function, hypergeometric functions and the hypergeometric equation, including brief discussion of monodromy.

[6]

Appropriate books

CLASSICAL DYNAMICS (C)

24 lectures, Michaelmas term

*Part IB Variational Principles is essential.***Review of Newtonian mechanics**

Newton's second law. Motion of N particles under mutual interactions. Euclidean and Galilean symmetry. Conservation laws of momentum, angular momentum and energy. [2]

Lagrange's equations

Configuration space, generalized coordinates and velocities. Holonomic constraints. Lagrangian, Hamilton's principle and Euler-Lagrange equations of motion. Examples: N particles with potential forces, planar and spherical pendulum, charged particle in a background electromagnetic field, purely kinetic Lagrangians and geodesics. Ignorable coordinates. Symmetries and Noether's theorem. [5]

Quadratic Lagrangians, oscillations, normal modes. [1]

Motion of a rigid body

Kinematics of a rigid body. Angular momentum, kinetic energy, diagonalization of inertia tensor. Euler top, conserved angular momentum, Euler equations and their solution in terms of elliptic integrals. Lagrange top, steady precession, nutation. [6]

Hamilton's equations

Phase space. Hamiltonian and Hamilton's equations. Simple examples. Poisson brackets, conserved quantities. Principle of least action. Liouville theorem. Action and angle variables for closed orbits in 2-D phase space. Adiabatic invariants (proof not required). Mention of completely integrable systems, and their action-angle variables. [7]

Hamiltonian systems in nonlinear phase spaces, e.g. classical spin in a magnetic field. 2-D motion of ideal point vortices. *Connections between Lagrangian/Hamiltonian dynamics and quantum mechanics.* [3]

Appropriate books

COSMOLOGY (C)

24 lectures, Michaelmas term

*Part IB Quantum Mechanics, Methods and Special Relativity are essential.***Introduction**

The matter content of the universe. Hierarchy of atoms, nucleons and quarks. The four forces of nature, brief mention of the standard model and unification. Dark matter. [1]

The expanding universe

The Cosmological Principle: homogeneity and isotropy. Derivation of Hubble's law. Scale factor of the universe. Kinematic effects, including redshift. Horizon problem. [2]

Simple Newtonian account of an expanding fluid. Derivation of Friedmann and Raychaudhuri equations. Possible worlds: open, closed, and flat models. Flatness problem. Age of the universe. The late universe. Inflation and the problems of the standard cosmology. [4]

Statistical physics

Particles in a box, statistical physics and definition of entropy. Laws of thermodynamics. Temperature and chemical potential. Ideal gases of bosons and fermions: classical and relativistic limits. Fermi degeneracy pressure. [3]

Stars and gravitational collapse

Thermostatic equilibrium and the virial theorem. Qualitative evolution of stars. White dwarfs and neutron stars as made up of self-gravitating degenerate Fermi gases. Mention of black holes. [4]

Thermal history of the universe

Cosmic microwave background. Recombination and photon decoupling. Planck spectrum. Conservation of entropy and particle number. Helium and primordial nucleosynthesis. Mention of matter/antimatter asymmetry and the early universe. [5]

Origin of structure in the universe

Definition of density perturbation. Cosmological perturbation equation derived. Simple growing mode solution. Fourier decomposition, mode evolution and power spectrum. Non-zero pressure and the Jeans length. [4]

Discussion of anisotropies in the cosmic microwave background. Simple description of inflationary fluctuations. [1]

Appropriate books

- E.R. Harrison *Cosmology: The Science of the Universe*. CUP 2000 (£35.00 hardback)
 A. Liddle *An Introduction to Modern Cosmology*. Wiley 1998 (£17.99 paperback)
 E.W. Kolb and M.S. Turner *The Early Universe*. Perseus 1994 (£40.99 paperback)

 S. Weinberg *The First Three Minutes*. Basic Books 1993 (£8.50 paperback)

LOGIC AND SET THEORY (D)

24 lectures, Michaelmas term

*No specific prerequisites.***Ordinals and cardinals**

Well-orderings and order-types. Examples of countable ordinals. Uncountable ordinals and Hartogs' lemma. Induction and recursion for ordinals. Ordinal arithmetic. Cardinals; the hierarchy of alephs. Cardinal arithmetic. [5]

Posets and Zorn's lemma

Partially ordered sets; Hasse diagrams, chains, maximal elements. Lattices and Boolean algebras. Complete and chain-complete posets; fixed-point theorems. The axiom of choice and Zorn's lemma. Applications of Zorn's lemma in mathematics. The well-ordering principle. [5]

Propositional logic

The propositional calculus. Semantic and syntactic entailment. The deduction and completeness theorems. Applications: compactness and decidability. [3]

Predicate logic

The predicate calculus with equality. Examples of first-order languages and theories. Statement of the completeness theorem; *sketch of proof*. The compactness theorem and the Löwenheim-Skolem theorems. Limitations of first-order logic. Model theory. [5]

Set theory

Set theory as a first-order theory; the axioms of ZF set theory. Transitive closures, epsilon-induction and epsilon-recursion. Well-founded relations. Mostowski's collapsing theorem. The rank function and the von Neumann hierarchy. [5]

Consistency

Problems of consistency and independence. [1]

Appropriate books

B.A. Davey and H.A. Priestley *Lattices and Order*. Cambridge University Press 2002 (£19.95 paperback)

T. Forster *Logic, Induction and Sets*. Cambridge University Press (£50.00 hardback)

A. Hajnal and P. Hamburger *Set Theory*. LMS Student Texts number 48, CUP 1999 (£55.00 hardback, £22.99 paperback)

† P.T. Johnstone *Notes on Logic and Set Theory*. Cambridge University Press 1987 (£15.95 paperback).

D. van Dalen *Logic and Structure*. Springer-Verlag 1994 (£18.50 paperback)

GRAPH THEORY (D)

24 lectures, Michaelmas term

*No specific prerequisites.***Introduction**

Basic definitions. Trees and spanning trees. Bipartite graphs. Euler circuits. Elementary properties of planar graphs. Statement of Kuratowski's theorem. [3]

Connectivity and matchings

Matchings in bipartite graphs; Hall's theorem and its variants. Connectivity and Menger's theorem. [3]

Extremal graph theory

Long paths, long cycles and Hamilton cycles. Complete subgraphs and Turán's theorem. Bipartite subgraphs and the problem of Zarankiewicz. The Erdős-Stone theorem; *sketch of proof*. [5]

Eigenvalue methods

The adjacency matrix and the Laplacian. Strongly regular graphs. [2]

Graph colouring

Vertex and edge colourings; simple bounds. The chromatic polynomial. The theorems of Brooks and Vizing. Equivalent forms of the four colour theorem; the five colour theorem. Heawood's theorem for surfaces; the torus and the Klein bottle. [5]

Ramsey theory

Ramsey's theorem (finite and infinite forms). Upper bounds for Ramsey numbers. [3]

Probabilistic methods

Basic notions; lower bounds for Ramsey numbers. The model $\mathcal{G}(n, p)$; graphs of large girth and large chromatic number. The clique number. [3]

Appropriate books

† B.Bollobás *Modern Graph Theory*. Springer 1998 (£26.00 paperback).

J.A.Bondy and U.S.R.Murty *Graph Theory with Applications*. Elsevier 1976 (available online via <http://www.ecp6.jussieu.fr/pageperso/bondy/bondy.html>)

R.Diestel *Graph Theory*. Springer 2000 (£38.50 paperback)

D.West *Introduction to Graph Theory*. Prentice Hall 1999 (£45.99 hardback)

GALOIS THEORY (D)

24 lectures, Michaelmas term

Groups, Rings and Modules is essential.

Field extensions, tower law, algebraic extensions; irreducible polynomials and relation with simple algebraic extensions. Finite multiplicative subgroups of a field are cyclic. Existence and uniqueness of splitting fields. [6]

Existence and uniqueness of algebraic closure. [1]

Separability. Theorem of primitive element. Trace and norm. [3]

Normal and Galois extensions, automorphic groups. Fundamental theorem of Galois theory. [3]

Galois theory of finite fields. Reduction mod p . [2]

Cyclotomic polynomials, Kummer theory, cyclic extensions. Symmetric functions. Galois theory of cubics and quartics. [4]

Solubility by radicals. Insolubility of general quintic equations and other classical problems. [3]

Artin's theorem on the subfield fixed by a finite group of automorphisms. Polynomial invariants of a finite group; examples. [2]

Appropriate books

E. Artin *Galois Theory*. Dover Publications (£6.99 paperback)

I. Stewart *Galois Theory*. Taylor & Francis Ltd Chapman & Hall/CRC 3rd edition (£24.99)

B. L. van der Waerden *Modern Algebra*. Ungar Pub 1949 (Out of print)

S. Lang *Algebra (Graduate Texts in Mathematics)*. Springer-Verlag New York Inc (£38.50 hardback)

I. Kaplansky *Fields and Rings*. The University of Chicago Press (£16.00 Paperback)

REPRESENTATION THEORY (D)

24 lectures, Lent term

*Linear Algebra, and Groups, Rings and Modules are essential.***Representations of finite groups**

Representations of groups on vector spaces, matrix representations. Equivalence of representations. Invariant subspaces and submodules. Irreducibility and Schur's Lemma. Complete reducibility for finite groups. Irreducible representations of Abelian groups.

Characters

Determination of a representation by its character. The group algebra, conjugacy classes, and orthogonality relations. Regular representation. Induced representations and the Frobenius reciprocity theorem. Mackey's theorem. [12]

Arithmetic properties of characters

Divisibility of the order of the group by the degrees of its irreducible characters. Burnside's $p^a q^b$ theorem. [2]

Tensor products

Tensor products of representations. The character ring. Tensor, symmetric and exterior algebras. [3]

Representations of S^1 and SU_2

The groups S^1 , SU_2 and $SO(3)$, their irreducible representations, complete reducibility. The Clebsch-Gordan formula. *Compact groups.* [4]

Further worked examples

The characters of one of $GL_2(F_q)$, S_n or the Heisenberg group. [3]

Appropriate books

J.L. Alperin and R.B. Bell *Groups and representations*. Springer 1995 (£37.50 paperback)

I.M. Isaacs *Character theory of finite groups*. Dover Publications 1994 (£12.95 paperback)

G.D. James and M.W. Liebeck *Representations and characters of groups*. Second Edition, CUP 2001 (£24.99 paperback)

J-P. Serre *Linear representations of finite groups*. Springer-Verlag 1977 (£42.50 hardback)

M. Artin *Algebra*. Prentice Hall 1991 (£56.99 hardback)

NUMBER FIELDS (D)**16 lectures, Lent term***Part IB Groups, Rings and Modules is essential and Part II Galois Theory is desirable.*

Definition of algebraic number fields, their integers and units. Norms, bases and discriminants. [3]

Ideals, principal and prime ideals, unique factorisation. Norms of ideals. [3]

Minkowski's theorem on convex bodies. Statement of Dirichlet's unit theorem. Determination of units in quadratic fields. [2]

Ideal classes, finiteness of the class group. Calculation of class numbers using statement of the Minkowski bound. [3]

Dedekind's theorem on the factorisation of primes. Application to quadratic fields. [2]

Discussion of the cyclotomic field and the Fermat equation or some other topic chosen by the lecturer. [3]

Appropriate books† Z.I. Borevich and I.R. Shafarevich *Number Theory*. Elsevier 1986 (out of print).† J. Esmonde and M.R. Murty *Problems in Algebraic Number Theory*. Springer 1999 (£38.50 hardback).E. Hecke *Lectures on the Theory of Algebraic Numbers*. Springer 1981 (out of print)† D.A. Marcus *Number Fields*. Springer 1977 (£30.00 paperback).I.N. Stewart and D.O. Tall *Algebraic Number Theory and Fermat's Last Theorem*. A K Peters 2002 (£25.50 paperback)**ALGEBRAIC TOPOLOGY (D)****24 lectures, Lent term***Either Analysis II or Metric and Topological Spaces is essential.***The fundamental group**

Homotopy of continuous functions and homotopy equivalence between topological spaces. The fundamental group of a space, homomorphisms induced by maps of spaces, change of base point, invariance under homotopy equivalence. [3]

The fundamental group of the circle

Covering spaces and covering maps. Path-lifting and homotopy-lifting properties, and the fundamental group of the circle. Topological proof of the fundamental theorem of algebra. [3]

Computing the fundamental groupFree groups, generators and relations for groups. Van Kampen's theorem. The fundamental group of the n -sphere, and of the closed (orientable) surface of genus g . [3]**Covering spaces**Statement of the correspondence, for a connected, locally contractible space X , between coverings of X and conjugacy classes of subgroups of the fundamental group of X , *and its proof*. The universal covering of X . The fundamental group of tori and real projective spaces. [3]**Simplicial complexes**

Finite simplicial complexes and subdivisions; the simplicial approximation theorem *and its proof*. [2]

HomologySimplicial homology, the homology groups of a simplex and its boundary. Functorial properties; the invariance of simplicial homology groups under homotopy equivalence. The homology of S^n ; Brouwer's fixed-point theorem. [6]**Homology calculations**

The Mayer-Vietoris sequence. Determination of the homology groups of closed surfaces. Orientability for surfaces. *The fundamental group and the first homology group.* The Euler characteristic. *Sketch of the classification of closed triangulable surfaces.* [4]

Appropriate booksM. A. Armstrong *Basic topology*. Springer 1983 (£38.50 hardback)W. Massey *A basic course in algebraic topology*. Springer 1991 (£50.00 hardback)C. R. F. Maunder *Algebraic Topology*. Dover Publications 1980 (£11.95 paperback)A. Hatcher *Algebraic Topology*. Cambridge University Press, 2001 (£20.99 paperback)

LINEAR ANALYSIS (D)**24 lectures, Michaelmas term***Part IB Linear Algebra, Analysis II and Metric and Topological Spaces are essential.*

Normed and Banach spaces. Linear mappings, continuity, boundedness, and norms. Finite-dimensional normed spaces. [4]

The Baire category theorem. The principle of uniform boundedness, the closed graph theorem and the inversion theorem; other applications. [5]

The normality of compact Hausdorff spaces. Urysohn's lemma and Tietze's extension theorem. Spaces of continuous functions. The Stone–Weierstrass theorem and applications. Equicontinuity: the Ascoli–Arzelà theorem. [5]

Inner product spaces and Hilbert spaces; examples and elementary properties. Orthonormal systems, and the orthogonalization process. Bessel's inequality, the Parseval equation, and the Riesz–Fischer theorem. Duality; the self duality of Hilbert space. [5]

Bounded linear operations, invariant subspaces, eigenvectors; the spectrum and resolvent set. Compact operators on Hilbert space; discreteness of spectrum. Spectral theorem for compact Hermitian operators. [5]

Appropriate books

† B. Bollobás *Linear Analysis*. 2nd Edition, Cambridge University Press 1999 (£22.99 paperback).

C. Goffman and G. Pedrick *A First Course in Functional Analysis*. 2nd Edition, Oxford University Press 1999 (£21.00 Hardback)

W. Rudin *Real and Complex Analysis*. McGraw–Hill International Editions: Mathematics Series (£31.00 Paperback)

RIEMANN SURFACES (D)**16 lectures, Michaelmas term***Complex Analysis is essential and Analysis II desirable.*

The complex logarithm. Analytic continuation in the plane; natural boundaries of power series. Informal examples of Riemann surfaces of simple functions (via analytic continuation). Examples of Riemann surfaces, including the Riemann sphere, and the torus as a quotient surface. [4]

Analytic, meromorphic and harmonic functions on a Riemann surface; analytic maps between two Riemann surfaces. The open mapping theorem, the local representation of an analytic function as $z \mapsto z^k$. Complex-valued analytic and harmonic functions on a compact surface are constant. [2]

Germ of an analytic map between two Riemann surfaces; the space of germs as a covering surface (in the sense of complex analysis). The monodromy theorem (statement only). The analytic continuation of a germ over a simply connected domain is single-valued. [3]

The degree of a map between compact Riemann surfaces; Branched covering maps and the Riemann–Hurwitz relation (assuming the existence of a triangulation). The fundamental theorem of algebra. Rational functions as meromorphic functions from the sphere to the sphere. [3]

Meromorphic periodic functions; elliptic functions as functions from a torus to the sphere. The Weierstrass P-function. [3]

Statement of the Uniformization Theorem; applications to conformal structure on the sphere, *to tori, and the hyperbolic geometry of Riemann surfaces*. [1]

Appropriate books

L.V.Ahlfors *Complex Analysis*. McGraw-Hill, 1979 (£112.99 Hardback)

A.F.Beardon *A Primer on Riemann Surfaces*. Cambridge University Press, 2004 (£35.00 hardback, £14.95 paperback)

G.A.Jones and D.Singerman *Complex functions: an algebraic and geometric viewpoint*. Cambridge University Press, 1987 (£28.00 Paperback)

E.T.Whittaker and G.N.Watson *A Course of Modern Analysis Chapters XX and XXI, 4th Edition*. Cambridge University Press, 1996 (£24.99 Paperback)

ALGEBRAIC GEOMETRY (D)**24 lectures, Lent term***Groups Rings and Modules is essential.*

Affine varieties and coordinate rings. Projective space, projective varieties and homogenous coordinates. Rational and regular maps. [4]
 Discussion of basic commutative algebra. Dimension, singularities and smoothness. [4]
 Conics and plane cubics. Quadric surfaces and their lines. Segre and Veronese embeddings. [4]
 Curves, differentials, genus. Divisors, linear systems and maps to projective space. The canonical class. [8]
 Statement of the Riemann-Roch theorem, with applications. [4]

Appropriate books

B. Hassett *Introduction to Algebraic Geometry*. Cambridge University Press, 2007 (£19.99 paperback)
 R. Hartshorne *Algebraic Geometry, chapters 1 and 4*. Springer 1997 (£44.00 hardback)

 K. Ueno *An Introduction to Algebraic Geometry*. American Mathematical Society 1977 (£22.45 paperback)

DIFFERENTIAL GEOMETRY (D)**24 lectures, Lent term***Analysis II and Geometry are very useful.*

Smooth manifolds in \mathbb{R}^n , tangent spaces, smooth maps and the inverse function theorem. Examples, regular values, Sard's theorem (statement only). [4]
 Notions of transversality and intersection numbers mod 2, degree mod 2. [3]
 Curves in 2-space and 3-space, arc-length, curvature, torsion. The isoperimetric inequality. [2]
 Smooth surfaces in 3-space, first fundamental form, area. [2]
 The Gauss map, second fundamental form, principal curvatures and Gaussian curvature. Theorema Egregium. [3]
 Minimal surfaces. Normal variations and characterization of minimal surfaces as critical points of the area functional. Isothermal coordinates and relation with harmonic functions. The Weierstrass representation. Examples. [3]
 Parallel transport and geodesics for surfaces in 3-space. Geodesic curvature. [2]
 The exponential map and geodesic polar coordinates. The Gauss-Bonnet theorem (including the statement about classification of compact surfaces). [3]
 Global theorems on curves: Fenchel's theorem (the total curvature of a simple closed curve is greater than or equal to 2π); the Fary-Milnor theorem (the total curvature of a simple knotted closed curve is greater than 4π). [2]

Appropriate books

P.M.H. Wilson *Curved Spaces*. CUP, January 2008 (£60 hardback, £24.99 paperback)

 J.A. Thorpe *Elementary Topics in Differential Geometry*. Springer-Verlag 1994 (£33.00 hardback)

PROBABILITY AND MEASURE (D)

24 lectures, Michaelmas term

Analysis II is essential.

Measure spaces, σ -algebras, π -systems and uniqueness of extension, statement *and proof* of Carathéodory's extension theorem. Construction of Lebesgue measure on \mathbb{R} . The Borel σ -algebra of \mathbb{R} . Existence of non-measurable subsets of \mathbb{R} . Lebesgue-Stieltjes measures and probability distribution functions. Independence of events, independence of σ -algebras. The Borel–Cantelli lemmas. Kolmogorov's zero-one law. [6]

Measurable functions, random variables, independence of random variables. Construction of the integral, expectation. Convergence in measure and convergence almost everywhere. Fatou's lemma, monotone and dominated convergence, differentiation under the integral sign. Discussion of product measure and statement of Fubini's theorem. [6]

Chebyshev's inequality, tail estimates. Jensen's inequality. Completeness of L^p for $1 \leq p \leq \infty$. The Hölder and Minkowski inequalities, uniform integrability. [4]

L^2 as a Hilbert space. Orthogonal projection, relation with elementary conditional probability. Variance and covariance. Gaussian random variables, the multivariate normal distribution. [2]

The strong law of large numbers, proof for independent random variables with bounded fourth moments. Measure preserving transformations, Bernoulli shifts. Statements *and proofs* of maximal ergodic theorem and Birkhoff's almost everywhere ergodic theorem, proof of the strong law. [4]

The Fourier transform of a finite measure, characteristic functions, uniqueness and inversion. Weak convergence, statement of Lévy's convergence theorem for characteristic functions. The central limit theorem. [2]

Appropriate books

- P. Billingsley *Probability and Measure*. Wiley 1995 (£67.95 hardback)
 R.M. Dudley *Real Analysis and Probability*. Cambridge University Press 2002 (£32.95 paperback)
 R.T. Durrett *Probability: Theory and Examples*. Wadsworth and Brooks/Cole 1991 (£55)
 D. Williams *Probability with Martingales*. Cambridge University Press (£20.95 paperback)

APPLIED PROBABILITY (D)

24 lectures, Lent term

Markov Chains is essential

Finite-state continuous-time Markov chains: basic properties. The homogeneous Poisson process and its generalisations (inhomogeneous Poisson processes, birth processes, birth and death processes, marked Poisson processes) [7]

General continuous-time Markov chains. Jump chains. Communicating classes. Hitting times and probabilities. Recurrence and transience. Positive and null recurrence. Convergence to equilibrium. Reversibility. [5]

Applications: the $M/M/1$ queue, the loss system, the $M/M/\infty$ system, the $M/M/s$ queue distribution of impurities, *Bartlett's theorem*, the $M/G/\infty$ queue, shot-noise processes, line processes. [5]

Renewal and renewal-reward processes. Applications: occurrence of patterns, maintenance models, regenerative processes, Little's formula, the $M/G/1$ queue, reservoir, epidemic and insurance ruin models. [7]

Appropriate books

- J.F.C. Kingman *Poisson Processes*. OUP 1993 (£30.00 hardback)
 G.R. Grimmett and D.R. Stirzaker *Probability and Random Processes*. OUP 2001 (£29.95 paperback)
 J.R. Norris *Markov Chains*. CUP 1997 (£20.95 paperback)

 Y. Suhov and M. Kelbert *Probability and Statistics by Example, vol II*. Cambridge University Press, date (£29.95, paperback)

PRINCIPLES OF STATISTICS (D)

24 lectures, Michaelmas term

*Part IB Statistics is essential***Principles and applications**

Sufficiency, minimal sufficiency, completeness. Exponential families. Rao-Blackwell theorem. Lehmann-Scheffe theorem. Ancillary statistics, conditionality and likelihood principles. [4]

Frequentist inference

Score function, Fisher information. Cramer-Rao lower bound. Maximum likelihood estimators and their asymptotic properties in the univariate parameter case: consistency, efficiency and asymptotic normality. Wald, score and likelihood ratio tests. Generalised likelihood ratio tests, Wilks' theorem. Profile likelihood. Bootstrap methods: roots (pivots), parametric and non-parametric bootstrap. Examples: bias, variance, and confidence set estimation. Non-parametric inference: Glivenko-Cantelli theorem, Kolmogorov-Smirnov test/confidence band. [8]

Bayesian inference

Prior and posterior distributions. Conjugate families, improper priors, predictive distributions. Asymptotic posterior distribution. Point estimation, credible regions, hypothesis testing and Bayes factors. Monte Carlo simulation: the Gibbs sampler and examples. [3]

Decision theory

Basic elements of a decision problem, including loss and risk functions. Decision rules, admissibility. Minimax and Bayes rules. Finite decision problems, risk set. General form of Bayes rules and their admissibility. Stein estimator. Two simple hypotheses. [4]

Multivariate analysis

Review of multivariate normal distribution. Correlation coefficient and distribution of sample version in a bivariate normal population. Partial correlation coefficients. Classification problems, linear discriminant analysis. Principal component analysis. [5]

Appropriate books

G. Casella and R.L Berger *Statistical Inference*. Duxbury 2001 ()
 A.C. Davison *Statistical Models*. Cambridge University Press 2003 (£27.99 paperback)
 P.H. Garthwaite, I.T. Jolliffe and B. Jones *Statistical Inference*. Oxford 2002 (£59.00 hardback)
 G.A. Young and R.L. Smith *Essentials of Statistical Inference*. Cambridge 2005 (£32.00 hardback)
 T.W. Anderson *An introduction to Multivariate Statistical Analysis*. Wiley 2003 ()

STOCHASTIC FINANCIAL MODELS (D)

24 lectures, Lent term

*Methods, Statistics, Probability and Measure, and Markov Chains are desirable.***Utility and mean-variance analysis**

Utility functions; risk aversion and risk neutrality. Portfolio selection with the mean-variance criterion; the efficient frontier when all assets are risky and when there is one riskless asset. The capital-asset pricing model. Reservation bid and ask prices, marginal utility pricing. Simplest ideas of equilibrium and market clearing. State-price density. [5]

Martingales

Conditional expectation, definition and basic properties. Conditional expectation, definition and basic properties. Stopping times. Martingales, supermartingales, submartingales. Use of the optional sampling theorem. [3]

Dynamic models

Introduction to dynamic programming; optimal stopping and exercising American puts; optimal portfolio selection. [3]

Pricing contingent claims

Lack of arbitrage in one-period models; hedging portfolios; martingale probabilities and pricing claims in the binomial model. Extension to the multi-period binomial model. Axiomatic derivation. [4]

Brownian motion

Introduction to Brownian motion; Brownian motion as a limit of random walks. Hitting-time distributions; changes of probability. [3]

Black-Scholes model

The Black-Scholes formula for the price of a European call; sensitivity of price with respect to the parameters; implied volatility; pricing other claims. Binomial approximation to Black-Scholes. Use of finite-difference schemes to computer prices [6]

Appropriate books

J. Hull *Options, Futures and Other Derivative Securities*. Prentice-Hall 2003 (£42.99 paperback)
 J. Ingersoll *Theory of Financial Decision Making*. Rowman and Littlefield 1987 (£52.00 hardback)

 P. Wilmott, S. Howison and J. Dewynne *The Mathematics of Financial Derivatives: a student introduction*. Cambridge University Press 1995 (£22.95 paperback)

OPTIMIZATION AND CONTROL (D)

16 lectures, Michaelmas term

*Optimization and Markov Chains are very helpful.***Dynamic programming**

The principle of optimality. The dynamic programming equation for finite-horizon problems. Interchange arguments. Markov decision processes in discrete time. Infinite-horizon problems: positive, negative and discounted cases. Value iteration. Policy improvement algorithm. Stopping problems. Average-cost programming. [6]

LQG systems

Linear dynamics, quadratic costs, Gaussian noise. The Riccati recursion. Controllability. Stabilizability. Infinite-horizon LQ regulation. Observability. Imperfect state observation and the Kalman filter. Certainty equivalence control. [5]

Continuous-time models

The optimality equation in continuous time. Pontryagin's maximum principle. Heuristic proof and connection with Lagrangian methods. Transversality conditions. Optimality equations for Markov jump processes and diffusion processes. [5]

Appropriate books

- D.P. Bertsekas *Dynamic Programming and Optimal Control, Volumes I and II*. Athena Scientific, 2001 (\$109.50)
 L. M. Hocking *Optimal Control: An introduction to the theory with applications*. Oxford 1991 (£27.99)

 P. Whittle *Optimization over Time Vols. I and II*. Wiley 1983 (out of print)
 P. Whittle *Optimal Control: Basics and Beyond*. Wiley 1995 (£130)

PARTIAL DIFFERENTIAL EQUATIONS (D)

24 lectures, Michaelmas term

*Analysis II, Methods, Variational Principles and either of Complex Methods or Complex Analysis are essential. Metric and Topological Spaces is desirable.***Introduction**

Prerequisites. Formal partial differential operators. Principal parts of quasilinear partial differential operators. Characteristics. The Cauchy problem and the Cauchy-Kovalewski Theorem (proof non-examinable). [3]

Classification of second order quasilinear partial differential operators in R^2 and definition of elliptic, parabolic and hyperbolic operators in R^n . [1]

Brief overview of necessary basics of functional analysis. Theory of Schwartz distributions. Distributional derivatives. Fundamental solutions of linear partial differential equations. [4]

Linear elliptic equations

Harmonic functions. Mean value property and elliptic regularity. Boundary value problems and Green's functions.

Elliptic minimum-maximum principles. Stability and uniqueness for Dirichlet boundary value problems. Weak solutions of elliptic boundary value problems. The Lax-Milgram Lemma. Sobolev spaces. Boundary and interior regularity. [7]

Linear parabolic initial boundary value problems

Fundamental solution of the heat equation. Parabolic minimum-maximum principles. Initial-boundary value problems on bounded intervals. Strongly continuous semigroups of linear operators. The Duhamel principle. Infinite speed of propagation and parabolic regularity. [6]

Linear hyperbolic partial differential equations

Solution of the one-dimensional wave equation. Eigenfunction expansion and groups of strongly continuous operators. Finite speed of propagation and hyperbolic regularity. [3]

Appropriate books

- L.C. Evans *Partial Differential equations*. American Mathematical Society, 1998 (£30)
 G. Folland *Introduction to Partial Differential Equations*. Princeton University Press 1996 (£42.84 hardback)
 E. DiBenedetto *Partial Differential Equations*. Birkhuser Boston, 2009 (£54)

ASYMPTOTIC METHODS (D)**16 lectures, Lent term***Either Complex Methods or Complex Analysis is essential, Part II Further Complex Methods is useful.***Asymptotic expansions**

Definition (Poincare) of $\phi(z) \sim \sum a_n z^{-n}$; examples; elementary properties; uniqueness; Stokes' phenomenon. [4]

Asymptotics behaviour of functions defined by integrals

Integration by parts. Watson's lemma (including proof) and Laplace's method. Riemann–Lebesgue lemma (including proof) and method of stationary phase. The method of steepest descent (including derivation of higher order terms). Application to Airy function. [7]

Asymptotic behaviour of solutions of differential equations

Asymptotic solution of second-order linear differential equations, including Liouville–Green functions (proof that they are asymptotic not required) and WKBJ with the quantum harmonic oscillator as an example. [4]

Recent developments

Further discussion of Stokes' phenomenon. *Asymptotics 'beyond all orders'*. [1]

Appropriate books

- † M.J. Ablowitz and A.S. Fokas *Complex Variables: Introduction and Applications*. CUP 2003 (£32, paperback).
 J.D. Murray *Asymptotic Analysis*. Springer 1984 (£41.00 hardback)

 C.M. Bender and S.A. Orszag *Advanced Mathematical Methods for Scientists and Engineers: Asymptotic Methods and Perturbation Theory*. Springer 1999 (£55.99 hardback)

INTEGRABLE SYSTEMS (D)**16 lectures, Lent term***Part IB Methods, and Complex Methods or Complex Analysis are essential; Part II Classical Dynamics is desirable.*

Integrability of ordinary differential equations: Hamiltonian systems and the Arnol'd–Liouville Theorem (sketch of proof). Examples. [3]

Integrability of partial differential equations: The rich mathematical structure and the universality of the integrable nonlinear partial differential equations (Korteweg-de Vries, sine-Gordon). Backlund transformations and soliton solutions. [2]

The inverse scattering method: Lax pairs. The inverse scattering method for the KdV equation, and other integrable PDEs. Multi soliton solutions. Zero curvature representation. [6]

Hamiltonian formulation of soliton equations. [2]

Painleve equations and Lie symmetries: Symmetries of differential equations, the ODE reductions of certain integrable nonlinear PDEs, Painleve equations. [3]

PRINCIPLES OF QUANTUM MECHANICS (D)

24 lectures, Michaelmas term

*IB Quantum Mechanics is essential.***Dirac formalism**

Bra and ket notation, operators and observables, probability amplitudes, expectation values, complete commuting sets of operators, unitary operators. Schrödinger equation, wave functions in position and momentum space. [3]

Time evolution operator, Schrödinger and Heisenberg pictures, Heisenberg equations of motion. [2]

Harmonic oscillator

Analysis using annihilation, creation and number operators. Significance for normal modes in physical examples. [2]

Multiparticle systems

Composite systems and tensor products, wave functions for multiparticle systems. Symmetry or anti-symmetry of states for identical particles, Bose and Fermi statistics, Pauli exclusion principle. [3]

Perturbation theory

Time-independent theory; second order without degeneracy, first order with degeneracy. [2]

Angular momentum

Analysis of states $|jm\rangle$ from commutation relations. Addition of angular momenta, calculation of Clebsch–Gordan coefficients. Spin, Pauli matrices, singlet and triplet combinations for two spin half states. [4]

Translations and rotations

Unitary operators corresponding to spatial translations, momenta as generators, conservation of momentum and translational invariance. Corresponding discussion for rotations. Reflections, parity, intrinsic parity. [3]

Time-dependent perturbation theory

Interaction picture. First-order transition probability, the golden rule for transition rates. Application to atomic transitions, selection rules based on angular momentum and parity, *absorption, stimulated and spontaneous emission of photons*. [3]

Quantum basics

Quantum data, qubits, no cloning theorem. Entanglement, pure and mixed states, density matrix. Classical determinism versus quantum probability, Bell inequality for singlet two-electron state, GHZ state. [2]

Appropriate books

† E. Merzbacher *Quantum Mechanics, 3rd edition*. Wiley 1998 (£36.99 hardback).

† B.H. Bransden and C.J. Joachain *Quantum Mechanics, 2nd edition*. Pearson (£37.99 paperback).

C.J. Isham *Lectures on Quantum Theory: Mathematical and Structural Foundations*. Imperial College Press 1995 (£14.00 paperback)

APPLICATIONS OF QUANTUM MECHANICS (D)

24 lectures, Lent term

*Principles of Quantum Mechanics is essential.***Variational Principle**

Variational principle, examples. [2]

Bound states and scattering states in one dimension

Bound states, reflection and transmission amplitudes. Examples. Relation between bound states and transmission amplitude by analytic continuation. [3]

Scattering theory in three dimensions

Classical scattering, definition of differential cross section. Asymptotic wavefunction for quantum scattering, scattering amplitude, cross section. Green's function, Born approximation to scattering on a potential. Spherically symmetric potential, partial waves and phase shifts, optical theorem. Low energy scattering, scattering length. Bound states and resonances as zeros and poles of S-matrix. [5]

Electrons in a magnetic field

Vector potential and Hamiltonian. Quantum Hamiltonian, inclusion of electron spin, gauge invariance, Zeeman splitting. Landau levels, effect of spin, degeneracy and filling effects, use of complex variable for lowest Landau level. Aharonov-Bohm effect. [4]

Particle in a one-dimensional periodic potential

Discrete translation group, lattice and reciprocal lattice, periodic functions. Bloch's theorem, Brillouin zone, energy bands and gaps. Floquet matrix, eigenvalues. Band gap in nearly-free electron model, tight-binding approximation. [3]

Crystalline solids

Introduction to crystal symmetry groups in three dimensions, Voronoi/Wigner-Seitz cell. Primitive, body-centred and face-centred cubic lattices. Reciprocal lattice, periodic functions, lattice planes, Brillouin zone. Bloch states, electron bands, Fermi surface. Basics of electrical conductivity: insulators, semiconductors, conductors. Extended zone scheme. [4]

Bragg scattering. Vibrations of crystal lattice, quantization, phonons. [3]

Appropriate books

D.J. Griffiths *Introduction to Quantum Mechanics*. 2nd edition, Pearson Education 2005 (£48.99 paperback)

N.W. Ashcroft and N.D. Mermin *Solid State Physics*. Holt–Saunders 1976 (£42.99 hardback)

L.D. Landau and E.M. Lifshitz *Quantum Mechanics (Course in Theoretical Physics Vol. 3)*. Butterworth–Heinemann, 1981 (£31.34 paperback)

STATISTICAL PHYSICS (D)**24 lectures, Lent term***Part IB Quantum Mechanics and “Multiparticle Systems” from Part II Principles of Quantum Mechanics are essential.***Fundamentals of statistical mechanics**

Microcanonical ensemble. Entropy, temperature and pressure. Laws of thermodynamics. Example of paramagnetism. Boltzmann distribution and canonical ensemble. Partition function. Free energy. Specific heats. [4]

Classical and quantum gases

Density of states and the classical limit. Idea gas. Maxwell distribution. Equipartition of energy. Diatomic gas. Planck distribution and black body radiation. Debye model of phonons in solids. Interacting gases. Virial expansion. Van der Waals equation of state. Basic kinetic theory. [8]

Thermodynamics

Thermodynamic temperature scale. Applications of laws of thermodynamics. Thermodynamic potentials. Maxwell relations. Heat and work. [3]

Grand canonical ensemble

Variable particle number. Chemical potential. Example of interacting classical gas. Bose-Einstein and Fermi-Dirac distributions. Bose-Einstein condensation. Ideal Fermi gas. Pauli paramagnetism. [6]

Phase transitions

Critical point in gases. Symmetries. Order parameters. First and second order phase transitions. Ising model. Mean field theory.

Appropriate books

ELECTRODYNAMICS (D)**16 lectures, Michaelmas term***Special Relativity and Electromagnetism are essential and Methods is desirable.***Electrostatics**

Revision of electrostatics. Potential due to a localized charge distribution. Dipole and quadrupole moments. [2]

Maxwell’s equations

Relativistic form of Maxwell’s equations and Lorentz force law. 4-vector potential and gauge invariance. Lorentz transformations. [3]

Charged particle dynamics

4-momentum and 4-force. Motion of charged particles in constant electric and magnetic fields. [2]

Energy and momentum

Electromagnetic field energy, momentum and stress tensor. Poynting’s theorem. Energy and momentum density of a plane electromagnetic wave. Radiation pressure. [2]

Electromagnetic radiation

Retarded potential of a time-dependent charge distribution. The radiation field. Dipole radiation. Energy radiated. [3]

Variational principles

Lagrangian for electromagnetic field with prescribed current, and for charged particles. [2]

Introduction to superconductors

Scalar electrodynamics as a model for a superconductor. Ginzburg–Landau Lagrangian and field equations. Magnetic flux and its quantization. [2]

Appropriate books

GENERAL RELATIVITY (D)

16 lectures, Michaelmas term

Methods and Special Relativity are essential.

Curved and Riemannian spaces. Special relativity and gravitation, the Pound–Rebka experiment. Introduction to general relativity: interpretation of the metric, clock hypothesis, geodesics, equivalence principles. Static spacetimes, Newtonian limit. [4]

Covariant and contravariant tensors, tensor manipulation, partial derivatives of tensors. Metric tensor, magnitudes, angles, duration of curve, geodesics. Connection, Christoffel symbols, absolute and covariant derivatives, parallel transport, autoparallels as geodesics. Curvature. Riemann and Ricci tensors, geodesic deviation. [5]

Vacuum field equations. Spherically symmetric spacetimes, the Schwarzschild solution. Rays and orbits, gravitational red-shift, light deflection, perihelion advance. Event horizon, gravitational collapse, black holes. [5]

Equivalence principles, minimal coupling, non-localisability of gravitational field energy. Bianchi identities. Field equations in the presence of matter, equations of motion. [2]

Appropriate books

FLUID DYNAMICS II (D)

24 lectures, Michaelmas term

Methods and Fluid Dynamics are essential.

It is recommended that students attend the associated Laboratory Demonstrations in Fluid Dynamics, which take place in the Michaelmas term.

Governing equations for an incompressible Newtonian fluid

Stress and rate-of-strain tensors and hypothesis of linear relation between them for an isotropic fluid; equation of motion; conditions at a material boundary; dissipation; flux of mass, momentum and energy; the Navier-Stokes equations. Dynamical similarity; steady and unsteady Reynolds numbers. [4]

Unidirectional flows

Couette and Poiseuille flows; the Stokes layer; the Rayleigh problem. [2]

Stokes flows

Flow at low Reynolds number; linearity and reversibility; uniqueness and minimum dissipation theorems. Flow in a corner; force and torque relations for a rigid particle in arbitrary motion; case of a rigid sphere and a spherical bubble. [4]

Flow in a thin layer

Lubrication theory; simple examples; the Hele-Shaw cell; gravitational spreading on a horizontal surface. [3]

Generation and confinement of vorticity

Vorticity equation; vortex stretching; flow along a plane wall with suction; flow toward a stagnation point on a wall; flow in a stretched line vortex. [3]

Boundary layers at high Reynolds number

The Euler limit and the Prandtl limit; the boundary layer equation for two-dimensional flow. Similarity solutions for flow past a flat plate and a wedge. *Discussion of the effect of acceleration of the external stream, separation.* Boundary layer at a free surface; rise velocity of a spherical bubble. [6]

Stability of unidirectional inviscid flow

Instability of a vortex sheet and of simple jets (e.g. vortex sheet jets). [2]

Appropriate books

D.J. Acheson *Elementary Fluid Dynamics*. Oxford University Press 1990 (£23.50 paperback)

G.K. Batchelor *An Introduction to Fluid Dynamics*. Cambridge University Press 2000 (£19.95 paperback)

E. Guyon, J-P Hulin, L. Petit and C.D. Matescu *Physical Hydrodynamics*. Oxford University Press 2000 (£59.50 hardback; £29.50 paperback)

L.D. Landau and E.M. Lifshitz *Fluid Mechanics*. Butterworth-Heinemann 1987 (£38.99 paperback)

WAVES (D)**24 lectures, Lent term***Methods is essential and Fluid Dynamics is very helpful.***Sound waves**

Equations of motion of an inviscid compressible fluid (without discussion of thermodynamics). Mach number. Linear acoustic waves; wave equation; wave-energy equation; plane waves. [3]

Elastic waves

Momentum balance; stress and infinitesimal strain tensors and hypothesis of a linear relation between them for an isotropic solid. Wave equations for dilatation and rotation; dilatation and shear potentials. Compressional and shear plane waves; simple problems of reflection and transmission. [6]

Dispersive waves

Rectangular acoustic wave guide; Love waves; cut-off frequency. Representation of a localised initial disturbance by a Fourier integral (one-dimensional case only); modulated wave trains; stationary phase. Group velocity as energy propagation velocity; dispersing wave trains. Water waves; internal gravity waves. [5]

Ray theory

Group velocity from wave-crest kinematics; ray tracing equations. Doppler effect; ship wave pattern. Cases where Fermat's Principle and Snell's law apply. [4]

Non-linear waves

One-dimensional unsteady flow of a perfect gas. Water waves. Riemann invariants; development of shocks; rarefaction waves; 'piston' problems. Rankine-Hugoniot relations for a steady shock. Hydraulic jumps. [6]

Appropriate books

J.D. Achenbach *Wave Propagation in Elastic Solids*. North Holland 1973 (approx. £60.00)

† J. Billingham and A.C. King *Wave Motion: Theory and application*. Cambridge University Press 2000 (£70.00 hardback, £24.95 paperback).

M.J. Lighthill *Waves in Fluids*. Cambridge University Press 1978 (£36.95 paperback)

G.B. Whitham *Linear and Nonlinear Waves*. Wiley 1999 (£53.95 paperback)

NUMERICAL ANALYSIS (D)**24 lectures, Lent term***Part IB Numerical Analysis is essential and Analysis II, Linear Algebra and Complex Methods or Complex Analysis are all desirable.***Iterative methods for linear algebraic systems**

Iterative methods, regular splittings and their convergence. Jacobi and Gauss-Seidel methods. Krylov spaces. Conjugate gradients and preconditioning. [5]

Computation of eigenvalues and eigenvectors

The power method and inverse iteration. Transformations to tridiagonal and upper Hessenberg forms. The QR algorithm for symmetric and general matrices, including shifts. [3]

Finite difference methods for the Poisson equation

Approximation of ∇^2 by finite differences. The accuracy of the five-point method in a square. Higher order methods. Solution of the difference equations by iterative methods, including multigrid. Fast Fourier transform (FFT) techniques. [5]

Finite difference methods for initial value partial differential equations

Difference schemes for the diffusion equation and the advection equation. Proof of convergence in simple cases. The concepts of well posedness and stability. Stability analysis by eigenvalue and Fourier techniques. Splitting methods. [6]

Spectral methods

Brief review of Fourier expansions. Calculation of Fourier coefficients with FFT. Spectral methods for the Poisson equation in a square with periodic boundary conditions. Chebyshev polynomials and Chebyshev methods. Spectral methods for initial-value PDEs. [5]

Appropriate books

G.H. Golub and C.F. van Loan *Matrix Computations*. Johns Hopkins Press 1996 (out of print)

K.W. Morton and D.F. Mayers *Numerical Solution of Partial Differential Equations: an Introduction*. Cambridge University Press 2005 (£30)

COMPUTATIONAL PROJECTS

The Faculty publishes a projects booklet by the end of the month of July preceding the Part II year. This contains details of the projects and information about course administration. The booklet is available on the Faculty website at <http://www.maths.cam.ac.uk/undergrad/catam/>

Each project is allocated a number of units of credit. Full credit may be obtained from the submission of projects with credit totalling 30 units. Credit for submissions totalling less than 30 units is awarded proportionately. There is no restriction on the choice of projects.

Once the booklet is available, the projects may be done at any time up to the submission deadline, which is near the beginning of the Easter Full Term.
