

UNIVERSITY OF CAMBRIDGE
Faculty of Mathematics

SCHEDULES OF LECTURE COURSES
FOR THE MATHEMATICAL TRIPOS 2003-2004

This booklet is intended for Part IB students

IMPORTANT NOTICE: Schedules 2003/04

Important Notice

For this year only the Schedules booklet is being printed in three versions, one for Part IA students, one for Part IB students and one for Part II students. The reason for this is that the Tripos is in the middle of significant revisions and it seemed too complicated to include all the different versions in one booklet.

This booklet contains the courses for Part IB (2003/04).

There are three main changes relevant to Part IB for the year 2003/04:

- (i) There are no longer any designated 'pull-forward' courses. The effect of this on Part IB is only that some courses are no longer lectured in different terms. To maintain flexibility in the timetable, Quantum Mechanics and Fluid Dynamics are still lectured in both Michaelmas and Lent terms.
- (ii) There are no longer any 'O-courses'.
- (iii) Four courses new to Part IB have been introduced:
Electromagnetism (16 lectures); Linear Algebra (24 lectures); Groups, Rings and Modules (24 lectures); Markov Chains (12 lectures).

Two courses have been discontinued: Linear Mathematics and Quadratic Mathematics. There is thus a modest increase in the number of lectures available, which is intended to compensate for the loss of the O-courses from the second year.

The Faculty Board has issued the following guideline regarding choice of course in Part IB:

Part IB of the Mathematical Tripos provides a wide range of courses from which students should, in consultation with their Directors of Studies, make a selection based on their individual interests and preferred work load, bearing in mind that it is better to do a number of courses thoroughly than to do many courses scrappily.

Students who took Linear Mathematics as a pull-forward course in their first year will not be disadvantaged by these changes: all the material in Linear Mathematics will appear in the schedules for the two new algebra courses. In particular, such students will be familiar with the first part of Linear Algebra; the lecturer will inform all students by e-mail when he is due to lecture new material.

Major changes are planned for Part II, to be implemented in 2004/05. The full details are not yet agreed, but the aim is combine the two existing Alternatives while retaining different styles of course. This means that the choice of courses will be hugely widened. Clearly, choice of courses in Part IB could be influenced by choices in Part II. Students should therefore discuss their choice of Part IB courses with their Directors of Studies bearing this in mind. Although the courses in Part II are not yet decided, Directors of Studies will be able to explain which Part IB courses are likely to be useful for the different areas of mathematics that will be covered in Part II. The Faculty Board recognises that this situation is not ideal, but believes it to be much preferable to the alternative of delaying the highly beneficial changes to Part II for another year.

SCHEDULES OF LECTURE COURSES

FOR THE MATHEMATICAL TRIPOS 2003-2004

Overview

Examinations

The form of each examination (number of questions in each section, number of questions which may be attempted, and range of subjects examined on each paper) is determined by the Faculty Board. Details are given later in this booklet in the *General Arrangements* sections for each part of the Tripos. The Faculty Board provides verbal classification criteria (see below) and recommends approximate percentages of candidates for each class (30% firsts, 40-45% upper seconds, 20-25% lower seconds, and not more than 6% thirds and below). Detailed marking schemes and actual borderlines are decided by the examiners.

The Faculty Board of Mathematics have *recommended* to Examiners that, in addition to a numerical mark, extra credit should be available for the completeness and quality of each answer. An *alpha* quality mark signifies an answer of high quality which is substantially complete (normally at least three-quarters of the marks). A *beta* quality mark normally signifies at least half marks.

Quality marks as well as numerical marks are taken into account by the examiners in deciding the class borderlines. Examiners use a merit mark which takes into account raw mark, number of alphas and number of betas to produce an initial ordering of candidates. The formula for the merit mark may vary from year to year, in the light of experience, and is different for different parts of the Tripos. The merit mark is not a mechanistic formula for classing candidates; it is merely a guide to help the examiners draw up rough borderlines between the classes.

Very careful scrutiny is given to candidates near the borderlines and other factors besides marks and quality marks may be taken into account. The Faculty Board recommends that no distinction is made between marks obtained on the computer projects and marks obtained in the exam room, and no requirement is placed on the candidates to produce answers on a range of mathematical material beyond that imposed by the structure of the exam itself. When it is being decided whether a candidate should obtain honours (i.e. be placed in the third or higher class), individual considerations are always paramount and a merit mark borderline is not normally given. The approximate borderlines of last year's examinations are given for guidance in the *General Arrangements* section of each part of the Tripos.

Examinations are 'single-marked', but safety checks are made on all scripts to ensure that all work is marked and all marks are correctly added and transcribed. Scripts are identified only by candidate number until the final class-lists have been drawn up.

Calculators are not allowed in any paper of Parts IB and II of the Tripos, nor in Papers 1-4 of Part IA. Examination questions will be set in such a way as not to require the use of calculators. Calculators of the kind approved by the Board of Examinations (Casio fx 100D, Casio fx 115D (any version) or Casio fx 570 (any version)) are permitted in the Computer Science and Physics papers of Options (b) and (c) of Part IA.

Formula booklets are not permitted, but candidates will not be required to quote elaborate formulae from memory.

Classification Criteria

Candidates in each part of the undergraduate Tripos are classified into four classes: first class, upper second class (2.1), lower second class (2.2) and third class. Candidates who do not achieve the level required for a third class either get an allowance towards an ordinary degree (i.e. not an honours degree), or they fail. Such students cannot normally continue working for an honours degree in mathematics.

The Faculty Board recommends to examiners the following criteria for deciding the different classes.

The First Class

Candidates placed in the first class will have demonstrated a full command and secure understanding of a considerable range of examinable material. They will have presented standard arguments accurately, showing skill in applying their knowledge, and generally will have produced substantially correct solutions to questions.

The Upper Second Class

Candidates placed in the upper second class will have demonstrated good knowledge and understanding of a range of examinable material. They will have presented standard arguments accurately and will have shown some ability to apply their knowledge to solve problems. A fair number of their answers to both straightforward and more challenging (parts of) questions will have been substantially correct.

The Lower Second Class

Candidates placed in the lower second class will have demonstrated knowledge but limited understanding of some of the examinable material. They will have been aware of relevant mathematical issues, but their presentation of standard arguments will sometimes have been fragmentary or imperfect. They will have difficulty completing questions and little success in tackling more challenging problems: they will have produced substantially correct solutions to some straightforward (parts of) questions, but many of their attempts will have been good but incomplete.

The Third Class

Candidates placed in the third class will have demonstrated some knowledge but little understanding of the examinable material. They will have made reasonable attempts at a small number of questions, but will have lacked the skills to complete many of them. Generally their accounts of standard arguments will have been garbled and their approach to problems misguided and ineffective.

Ordinary or Fail

Candidates not classed 'with honours' will have demonstrated little or no knowledge of the examinable material. Their answers to questions will have been generally misguided or fragmentary, and their account of even straightforward bookwork will have been garbled or wrong. They will have shown little awareness of the mathematical issues involved in solving the problems set.

Data Protection Act 1998

To meet the University's obligations under the Data Protection Act 1998, the Faculty deals with data relating to individuals and their examination marks as follows:

- Marks for individual questions and Computational Projects are released routinely after the examinations.
- Data appearing on individual examination scripts are available on application to the University Data Protection Officer and on payment of a fee. Scripts are kept, in line with the University policy, for four months following the examinations and are then destroyed.

You should note that Examiners write little more on scripts than ticks, crosses, underlines and mark subtotals and totals.

Lectures

The schedule for each course is minimal for lecturing and maximal for examining. The topics starred in the schedules will be lectured, but questions will not be set on them in examinations. The numbers which appear in brackets at the end of subsections or paragraphs indicate the approximate number of lectures likely to be devoted to the subsection or paragraph concerned.

The Faculty Board revise the Schedules from time to time. The Secretary will be glad to receive comments for consideration by the Board.

Supervisions

Directors of Studies will arrange supervisions for each course as they think appropriate. Lecturers will hand out examples sheets which supervisors may use. According to Faculty Board guidelines, the number of examples sheets for 24-lecture, 16-lecture and 12-lecture courses should be 4, 3 and 2 respectively.

Feedback

Constructive feedback of all sorts and from all sources is welcomed by everyone concerned in providing courses for the Mathematical Tripos. There are many different feedback routes. Each lecturer hands out a questionnaire towards the end of the course and students are sent a combined e-mail questionnaire at the end of each year. These questionnaires are particularly important in shaping the future of the Tripos and the Faculty Board urge all students to respond. To give feedback during the course of the term, students can e-mail the Faculty Board and Teaching Committee students representatives and anyone can e-mail the anonymous rapid response Faculty 'hotline' `hotline@maths.cam.ac.uk`. Feedback can be sent directly to the Teaching Committee via the Faculty Office. Feedback on college-provided teaching can be given to Directors of Studies or Tutors at any time.

Student Representatives

There are two student representatives on each of the Faculty Board, the Teaching Committee and the Curriculum Committee, who are normally elected or appointed in January or February of each year. Their role is to advise the committees on the student point of view, to collect opinion from and liaise with the student body. They operate a website :

`http://www.damtp.cam.ac.uk/user/studrep`

and their email address is :

`student.reps@damtp.cam.ac.uk`.

Books

A list of books is given after each schedule. Books marked with † are particularly well suited to the course. Some of the books are out of print; these are retained on the list because they should be available in college libraries (as should all the books on the list) and may be found in second-hand bookshops.

Aims and Objectives

The **aims** of the Faculty for Parts IA, IB and II of the Mathematical Tripos are:

- to provide a challenging course in mathematics and its applications for a range of students that includes some of the best in the country;
- to provide a course that is suitable both for students aiming to pursue research and for students going into other careers;
- to provide an integrated system of teaching which can be tailored to the needs of individual students;
- to develop in students the capacity for learning and for clear logical thinking;
- to continue to attract and select students of outstanding quality;
- to produce the high calibre graduates in mathematics sought by employers in universities, the professions and the public services.
- to provide an intellectually stimulating environment in which students have the opportunity to develop their skills and enthusiasms to their full potential;
- to maintain the position of Cambridge as a leading centre, nationally and internationally, for teaching and research in mathematics.

The **objectives** of Parts IA, IB and II of the Mathematical Tripos are as follows:

After completing Part IA, students should have:

- made the transition in learning style and pace from school mathematics to university mathematics;
- been introduced to basic concepts in higher mathematics and their applications, including (i) the notions of proof, rigour and axiomatic development, (ii) the generalisation of familiar mathematics to unfamiliar contexts, (iii) the application of mathematics to problems outside mathematics;
- laid the foundations, in terms of knowledge and understanding, of tools, facts and techniques, to proceed to Part IB.

After completing Part IB, students should have:

- covered material from a range of pure mathematics, statistics and operations research, applied mathematics, theoretical physics and computational mathematics, and studied some of this material in depth;
- acquired a sufficiently broad and deep mathematical knowledge and understanding to enable them both to make an informed choice of courses in Part II and also to study these courses.

After completing Part II, students should have:

- developed the capacity for (i) solving both abstract and concrete problems, (ii) presenting a concise and logical argument, and (iii) (in most cases) using standard software to tackle mathematical problems;
- studied advanced material in the mathematical sciences, some of it in depth.

PART IB

GENERAL ARRANGEMENTS

Overview

Sixteen courses, including Computational Projects, are examined in Part IB.

The lectures for Computational Projects will normally be attended in the Easter term of the first year, the Computational Projects themselves being done in the Michaelmas and Lent Terms of the second year (or in the preceding Long Vacation).

Some courses are lectured twice, to give the timetable greater flexibility: Quantum Mechanics and Fluid Dynamics are lectured in Michaelmas and Lent terms; Special Relativity is lectured in Easter term and Lent term.

Three courses (Optimisation, Geometry and Numerical Analysis) can be taken in the Easter term either of the first year or of the second year.

The Faculty Board of Mathematics give notice that the form of the examination for Part IB of the Mathematical Tripos is as follows:

The examination shall consist of Papers 1–4. Every candidate shall offer all four papers.

Each paper will be divided into two sections. Candidates may attempt at most four questions from Section I and at most six questions in Section II. Each question in Section II will carry twice the weight of each question in Section I.

The papers will examine courses all Part IB courses except the Computational Projects. Questions on the different courses will be distributed among the papers as specified in the following table. A 24-lecture course will have a total of four questions in Section I and four questions in Section II, a 16-lecture course will have three, and a 12-lecture course two. There are exceptions in the cases of Electromagnetism and Special Relativity, for which the *combined* number of questions will be four in each section, of which either one or two in each section will be on Special Relativity.

Computational Projects

There is no written examination for the course Computational Projects, credit for examination purposes being gained by the submission of notebooks. The maximum credit obtainable is 80 marks and 8 alphas or betas, and credit obtained is added to the credit gained in the written examination.

The detailed distribution of the questions will be as follows:

	Paper 1	Paper 2	Paper 3	Paper 4
Linear Algebra	*	*	*	*
Groups, Rings and Modules	*	*	*	*
Geometry			*	
Analysis II	*	*	*	*
Further Analysis		*	*	*
Complex Methods	*	*		*
Methods	*	*	*	*
Electromagnetism	*	*	(*)	
Relativity			(*)	*
Quantum Mechanics	*	*		*
Fluid Dynamics	*		*	*
Numerical Analysis		*	*	
Statistics	*	*		*
Optimization			*	*
Markov Chains	*	*		

Section I questions are marked out of 10, one alpha or one beta being available, and Section II questions are marked out of 20, one double alpha or one double beta being available.

Last year, the examiners used the following formula to obtain the merit mark (M) in terms of the number of raw marks (m), the number of alphas (α) and the number of betas (β):

$$M = \begin{cases} 2m + 10\alpha + 3\beta - 72 & \text{for } \alpha \geq 24 \\ 2m + 7\alpha + 3\beta & \text{for } \alpha < 24 \end{cases}$$

The following table shows the merit mark used by the examiners for initial borderlines and the marks, alphas and betas of a typical candidate placed near the bottom of each class. At the lowest borderlines, individual consideration of candidates is always paramount, so no initial borderline is used and there are no typical candidates; *very few* candidates fail to achieve at least a third class.

Borderline	Merit mark	Borderline candidate
1/2(i)	1075	395,33,9
2(i)/2(ii)	735	276,21,12
2(ii)/3	510	201,10,15

LINEAR ALGEBRA

24 lectures, Michaelmas term

Definition of a vector space (over \mathbb{R} or \mathbb{C}), subspaces, the space spanned by a subset. Linear independence, bases, dimension. Direct sums and complementary subspaces. [3]

Linear maps, isomorphisms. Relation between rank and nullity. The space of linear maps from U to V , representation by matrices. Change of basis. Row rank and column rank. [4]

Determinant and trace of a square matrix. Determinant of a product of two matrices and of the inverse matrix. Determinant of an endomorphism. The adjugate matrix. [3]

Eigenvalues and eigenvectors. Diagonal and triangular forms. Characteristic and minimal polynomials. Cayley-Hamilton Theorem over \mathbb{C} . Algebraic and geometric multiplicity of eigenvalues. Statement and illustration of Jordan normal form. [4]

Dual of a finite-dimensional vector space, dual bases and maps. Matrix representation, rank and determinant of dual map [2]

Bilinear forms. Matrix representation, change of basis. Symmetric forms and their link with quadratic forms. Diagonalisation of quadratic forms. Law of inertia, classification by rank and signature. Complex Hermitian forms. [4]

Inner product spaces, orthonormal sets, orthogonal projection, $V = W \oplus W^\perp$. Gram-Schmidt orthogonalisation. Adjoints. Diagonalisation of Hermitian matrices. Orthogonality of eigenvectors and properties of eigenvalues. [4]

Appropriate books

C.W. Curtis *Linear Algebra: an introductory approach*. Springer 1984 (£38.50 hardback).

P.R. Halmos *Finite-dimensional vector spaces*. Springer 1993 (£31.50 hardback).

K. Hoffman and R. Kunze *Linear Algebra*. Prentice-Hall 1971 (£72.99 hardback).

Groups

Basic concepts of group theory recalled from Algebra and Geometry. Normal subgroups, quotient groups and isomorphism theorems. Permutation groups. Groups acting on sets, permutation representations. Conjugacy classes, centralizers and normalizers. The centre of a group. Elementary properties of finite p -groups. Examples of finite linear groups and groups arising from geometry. Simplicity of A_5 .

Sylow subgroups and Sylow theorems. Applications, groups of small order. [7]

Rings

Definition and examples of rings (commutative, with 1). Ideals, homomorphisms, quotient rings, isomorphism theorems. Prime and maximal ideals. Fields. The characteristic of a field. Field of fractions of an integral domain.

Factorization in rings; units, primes and irreducibles. Unique factorization in principal ideal domains, and in polynomial rings. Gauss' Lemma and Eisenstein's irreducibility criterion.

Rings $\mathbb{Z}[\alpha]$ of algebraic integers as subsets of \mathbb{C} and quotients of $\mathbb{Z}[x]$. Examples of Euclidean domains and uniqueness and non-uniqueness of factorization. Factorization in the ring of Gaussian integers; representation of integers as sums of two squares.

Ideals in polynomial rings. Hilbert basis theorem. [9]

Modules

Definitions, examples of vector spaces, abelian groups and vector spaces with an endomorphism. Submodules, homomorphisms, quotient modules and direct sums. Equivalence of matrices, canonical form. Structure of finitely generated modules over Euclidean domains, applications to abelian groups and Jordan normal form. [8]

Appropriate books

P.M.Cohn *Classic Algebra*. Wiley, 2000 (£29.95 paperback).

J.B. Fraleigh *A First Course in abstract Algebra*. Addison Wesley, 2003 (£47.99 paperback).

B. Hartley and T.O. Hawkes *Rings, Modules and Linear Algebra: a further course in algebra*. Chapman and Hall, 1970 (out of print).

I. Herstein *Topics in Algebra*. John Wiley and Sons, 1975 (£45.99 hardback).

P.M. Neumann, G.A. Stoy and E.C. Thomson *Groups and Geometry*. OUP 1994 (£35.99 paperback).

M. Artin *Algebra*. Prentice Hall, 1991 (£53.99 hardback).

Uniform convergence

The general principle of uniform convergence. A uniform limit of continuous functions is continuous. Uniform convergence and termwise integration and differentiation of series of real-valued functions. Local uniform convergence of power series. [3]

Uniform continuity and integration

Continuous functions on closed bounded intervals are uniformly continuous. Review of basic facts on Riemann integration (from Analysis I); proof that piecewise-continuous functions are integrable. Informal discussion of integration of complex-valued and \mathbb{R}^n -valued functions of one variable; proof that $\|\int_a^b f(x) dx\| \leq \int_a^b \|f(x)\| dx$. [2]

 \mathbb{R}^n as a normed space

Definition of a normed space. Examples, including the Euclidean norm on \mathbb{R}^n and the uniform norm on $\mathcal{C}[a, b]$. Lipschitz mappings and Lipschitz equivalence of norms. The Bolzano–Weierstrass theorem in \mathbb{R}^n . Completeness. Open and closed sets. Continuity for functions between normed spaces. A continuous function on a closed bounded set in \mathbb{R}^n is uniformly continuous and has closed bounded image. All norms on a finite-dimensional space are Lipschitz equivalent. [5]

Differentiation from \mathbb{R}^m to \mathbb{R}^n

Definition of derivative as a linear map; elementary properties, the chain rule. Partial derivatives; continuous partial derivatives imply differentiability. Higher-order derivatives; symmetry of mixed partial derivatives (assumed continuous). Taylor’s theorem. The mean value inequality. [5]

Metric spaces

Definition and examples. *Metrics used in Geometry.* Limits, continuity, balls, neighbourhoods, open and closed sets. Completeness and total boundedness; equivalence of the conjunction of these properties with the Bolzano–Weierstrass property. [5]

The Contraction Mapping Theorem

The contraction mapping theorem. Applications including the inverse function theorem (proof of continuity of inverse function, statement of differentiability). Picard’s solution of differential equations. *Green’s function solution of second-order differential equations*. [4]

Appropriate books

† J.C. Burkill and H. Burkill *A Second Course in Mathematical Analysis*. Cambridge University Press 2002 (£29.95 paperback).

A.F. Beardon *Limits: a new approach to real analysis*. Springer 1997 (£22.50 hardback).

† W. Rudin *Principles of Mathematical Analysis*. McGraw–Hill 1976 (£35.99 paperback).

W.A. Sutherland *Introduction to Metric and Topological Space*. Clarendon 1975 (£21.99 paperback).

A.J. White *Real Analysis: An Introduction*. Addison–Wesley 1968 (out of print).

T.W. Körner *A companion to analysis*. (Unpublished manuscript available from www.dpmms.cam.ac.uk/twk until 30th November 2003). After this, the book should be published by the AMS

Topological spaces

Topological spaces. Continuous maps and homeomorphisms. Examples. Subspaces, quotients, the product of finitely many spaces. Hausdorff spaces. [1]

Compactness

Definition using open covers. The continuous image of a compact space is compact. The product of compact spaces is compact. Compact metric spaces: sequential compactness; uniform continuity of continuous functions. Equivalence for subsets of \mathbb{R}^n of ‘compact’, ‘sequentially compact’ and ‘closed and bounded’. [3]

Connectedness

Connectedness in terms of open sets and of continuous integer-valued functions. The continuous image of a connected space is connected. Connected subsets of \mathbb{R} . Path-connectedness implies connectedness. Connected open subspaces of \mathbb{R}^n are path-connected. [2]

Contour integration

Definition and elementary properties of contour integrals. Cauchy’s theorem for a triangle. Invariance under homotopy. Cauchy’s theorem in a simply connected domain. Cauchy’s integral formulae. The maximum modulus principle. Liouville’s theorem and applications. Morera’s theorem. Winding numbers. The residue theorem. Rouché’s theorem. Statement *and proof* of the homology form of Cauchy’s theorem. [7]

Analytic functions

Local uniform convergence and termwise differentiation of analytic functions. Taylor’s theorem. Order of a zero; isolation of zeros and the identity principle. Open mapping theorem. The classification of isolated singularities. Relation to Laurent series. [3]

Appropriate books

L.V. Ahlfors *Complex Analysis*. McGraw–Hill 1979 (£112.99 hardback).

A.F. Beardon *Complex Analysis: the argument principle in analysis and topology*. Wiley 1979 (out of print).

† G.J.O. Jameson *A First Course on Complex Functions*. Chapman and Hall 1970 (out of print).

H.A. Priestley *Introduction to Complex Analysis*. Clarendon 1990 (out of print). 2nd ed. due for publication August 2003

† W.A. Sutherland *Introduction to Metric and Topological Spaces*. Clarendon 1975 (£21.00 paperback).

E.C. Titchmarsh *The Theory of Functions*. Oxford University Press 1976 (£45.00 paperback).

A.J.White *Real Analysis: An Introduction (Chapter 5)*. Addison–Wesley 1968 (out of print).

GEOMETRY

12 lectures, Easter term

Spherical geometry

Geodesics, spherical triangles and the Gauss–Bonnet theorem. Triangulations of the sphere and the Euler number. [2]

Euclidean geometry

Groups of rigid motions of Euclidean space. Rotation and reflection groups in three dimensions. Construction of regular polyhedra via reflection groups; calculation of their symmetry groups. [3]

Möbius geometry

Stereographic projections of the sphere. Rotations of the sphere and Möbius transformations. [2]

Hyperbolic geometry

The hyperbolic plane, Poincaré models and the Riemannian metric. Geodesics and angles. Isometry group. Hyperbolic triangles (including some elementary trigonometry); Gauss–Bonnet theorem. [4]

Curvature

Informal discussion of curvature based on earlier appearances of the idea in the course. [1]

Appropriate books

V.V. Nikulin and I. Shafarevich *Geometries and Groups*. Springer 1987 (£40.00 paperback).

† E. Rees *Notes on Geometry*. Springer 1983 (£16.50 paperback).

J.R. Weeks *The Shape of Space*. Dekker 2002 (£26.00 hardback).

Fourier series and the wave equation

Periodic functions. Fourier series. Parseval's theorem. Wave equation for a string. Separation of variables. Normal modes for a string of finite length. Energy. Solution of form $f(x + ct) + g(x - ct)$. Wave reflection and transmission. [4]

Ordinary differential equations

Equations of the second order; initial value problems and problems with two fixed end points; solution using Green's function: notion of Green's function as an inverse operator. The Sturm–Liouville equation; eigenfunction and eigenvalues: reality of eigenvalues and orthogonality of eigenfunctions; eigenfunctions expansions (Fourier series as prototype), approximation in mean square, statement of completeness; expansion of δ -function and Green's function. [6]

Laplace's equation

Separation of variables in Cartesians, plane polar and spherical polar co-ordinates, solutions in spherical polars for axisymmetric systems only. Legendre's equation and solutions as Legendre polynomials (statement only); orthogonality; forms of P_0 , P_1 and P_2 . [3]

Calculus of variations

Stationary points of $f(x_1, \dots, x_n)$: necessary and sufficient conditions for the free case; Lagrange multipliers, necessary conditions for the constrained case. Euler–Lagrange equations, functional derivatives, first integrals; use of Lagrange multipliers (statement only). Examples e.g. Fermat's principle. [5]

Cartesian tensors in \mathbb{R}^3

Tensor transformation laws, addition, multiplication, contraction, the quotient theorem. Isotropic second and third rank tensors. Symmetric and antisymmetric tensors. Revision of principal axes and diagonalization. Examples e.g. inertia, stress, conductivity. [6]

Appropriate books

- G. Arfken and H. Weber *Mathematical Methods for Physicists*. Harcourt Academic 2001 (£38.95 hardback).
- M.L. Boas *Mathematical Methods in the Physical Sciences*. Wiley 1983 (£34.50 hardback).
- H. Jeffreys *Cartesian Tensors*. Cambridge University Press 1931 (out of print).
- H. Jeffreys and B.S. Jeffreys *Methods of Mathematical Physics*. Cambridge University Press 1999 (£25.95 paperback).
- J. Mathews and R.L. Walker *Mathematical Methods of Physics*. Benjamin/Cummings 1970 (£68.99 hardback).
- K. F. Riley, M. P. Hobson, and S.J. Bence *Mathematical Methods for Physics and Engineering: a comprehensive guide*. Cambridge University Press 2002 (£29.95 paperback).
- B. Spain *Tensor Calculus*. Dover 2003 (£8.95 paperback).

Analytic functions

Definition of an analytic function. Cauchy-Riemann equations. Analytic functions as conformal mappings; examples. Application to the solutions of Laplace's equation in various domains. Discussion of $\log z$ and z^a . [3]

Contour integration and Cauchy's Theorem

[Proofs of theorems in this section will not be examined in this course.]

Domains, contours, contour integrals. Cauchy's theorem and Cauchy's integral formula. Taylor and Laurent series. Zeros, poles and essential singularities. [3]

Residue calculus

Cauchy's residue theorem, calculus of residues. Jordan's lemma. Evaluation of definite integrals by contour integration. [5]

Fourier transforms

Definition and simple properties. The inversion formula. Applications to differential equations. Computation of transforms by contour integration. Transforms of step and delta functions.

Convolution. Parseval's formula. Application to time-invariant linear 'input' and 'output' systems. Causality. Frequency analysis of signals. [5]

Appropriate books

M.J. Ablowitz A.S. Fokas *Complex variables: introduction and applications*. CUP 2003 (£65.00).

G. Arfken and H. Weber *Mathematical Methods for Physicists*. Harcourt Academic 2001 (£38.95 paperback).

G. J. O. Jameson *A First Course in Complex Functions*. Chapman and Hall 1970 (out of print).

† H.A. Priestley *Introduction to Complex Analysis*. Clarendon 1990 (out of print).

† I. Stewart and D. Tall *Complex Analysis (the hitchhiker's guide to the plane)*. Cambridge University Press 1983 (£24.95 paperback).

Physical background

Photoelectric effect. Electrons in atoms and line spectra. Particle diffraction. [1]

Schrödinger equation and solutions

De Broglie waves. Schrödinger equation. Superposition principle. Probability interpretation, density and current. [2]

Stationary states. Free particle, Gaussian wave packet. Motion in 1-dimensional potentials, parity. Potential step, square well and barrier. Harmonic oscillator. [4]

Observables and expectation values

Position and momentum operators and expectation values. Canonical commutation relations. Uncertainty principle. [2]

Observables and Hermitian operators. Eigenvalues and eigenfunctions. Formula for expectation value. [2]

Hydrogen atom

Spherically symmetric wave functions for spherical well and hydrogen atom.

Orbital angular momentum operators. General solution of hydrogen atom. [5]

Appropriate books

Feynman, Leighton and Sands *v. 3 Ch 1-3 of the Feynman lectures on Physics*. Addison-Wesley 1970 (£87.99 paperback).

† S. Gasiorowicz *Quantum Physics*. Wiley 2003 (£34.95 hardback).

† A.I.M. Rae *Quantum Mechanics*. Institute of Physics Publishing 2002 (£16.99 paperback).

L.I. Schiff *Quantum Mechanics*. McGraw Hill 1968 (£38.99 hardback).

Introduction to Maxwell's equations

Electric and magnetic fields, charge, current. Maxwell's equations and the Lorentz force. Charge conservation. Integral form of Maxwell's equations and their interpretation. Scalar and vector potentials; gauge transformations. [3]

Electrostatics

Point charges and the inverse square law, line and surface charges, dipoles. Electrostatic energy. Gauss's law applied to spherically symmetric and cylindrically symmetric charge distributions. Plane parallel capacitor. [3]

Steady currents

Ohm's law, flow of steady currents. Magnetic fields due to steady currents, simple examples treated by means of Ampère's equation. Vector potential due to a general current distribution, the Biot–Savart law. Magnetic dipoles. Lorentz force on steady current distributions and force between current-carrying wires. [4]

Electromagnetic induction

Faraday's law of induction for fixed and moving circuits; simple dynamo. [2]

Electromagnetic waves

Electromagnetic energy and Poynting vector. Plane electromagnetic waves in vacuum, polarisation. Reflection at a plane conducting surface. [4]

Appropriate books

INTRODUCTION TO SPECIAL RELATIVITY

8 lectures, Easter and Lent terms

[Lecturers should use the signature convention (+ - - -).]

Space and time

The principle of relativity. Relativity and simultaneity. The invariant interval. Lorentz transformations in $(1 + 1)$ -dimensional spacetime. Time dilation and muon decay. Length contraction. The Minkowski metric for $(1 + 1)$ -dimensional spacetime. [4]

4-vectors

Lorentz transformations in $(3 + 1)$ dimensions. 4-vectors and Lorentz invariants. Proper time. 4-velocity and 4-momentum. Conservation of 4-momentum in radioactive decay. [4]

Appropriate books

G.F.R. Ellis and R.M. Williams *Flat and Curved Space-times*. Oxford University Press 2000 (£24.95 paperback).

† W. Rindler *Introduction to Special Relativity*. Oxford University Press 1991 (£19.99 paperback).

W. Rindler *Relativity: special, general and cosmological*. OUP 2001 (£24.95 paperback).

† E.F. Taylor and J.A. Wheeler *Spacetime Physics: introduction to special relativity*. Freeman 1992 (£29.99 paperback).

Kinematics

Continuum fields: density and velocity. Flow visualisation: particle paths, streamlines and dye streaklines. Material time derivative. Conservation of mass and the kinematic boundary condition at a moving boundary. Incompressibility and streamfunctions. [3]

Dynamics

Surface and volume forces; pressure in frictionless fluids. The Euler momentum equation. Applications of the momentum integral.

Bernoulli's theorem for steady flows with potential forces; applications.

Vorticity, vorticity equation, vortex line stretching, Kelvin's circulation theorem, irrotational flow remains irrotational. [4]

Potential flows

Velocity potential; Laplace's equation. Examples of solutions in spherical and cylindrical geometry by separation of variables.

Expression for pressure in time-dependent potential flows with potential forces; applications. Spherical bubbles; small oscillations, collapse of a void. Translating sphere and inertial reaction to acceleration, *effects of friction*. Fluid kinetic energy for translating sphere.

Translating cylinder with circulation and lift force, *generation of circulation.* [6]

Interfacial flows

Governing equations and boundary conditions. Linear water waves: dispersion relation, deep and shallow water, particle paths, standing waves in a container. Rayleigh-Taylor instability.

River flows: over a bump, out of a lake over a broad weir, hydraulic jumps. [3]

Appropriate books

- † D.J. Acheson *Elementary Fluid Dynamics*. Oxford University Press 1990 (£25.50 paperback).
 G.K. Batchelor *An Introduction to Fluid Dynamics*. Cambridge University Press 2000 (£23.95 paperback).
 E. Guyon, J.P. Hulin, L. Petit and C.D. Matescu *Physical Hydrodynamics*. Oxford University Press 2001 (£32.50 paperback).
 G.M. Homsey et. al. *Multi-Media Fluid Mechanics*. Cambridge University Press 2000 (CD-ROM for Windows or Macintosh, £14.95).
 M.J. Lighthill *An Informal Introduction to Theoretical Fluid Mechanics*. Oxford University Press 1986 (out of print).
 † A.R. Paterson *A First Course in Fluid Dynamics*. Cambridge University Press 1983 (£48.95 paperback).
 M. van Dyke *An Album of Fluid Motion*. Parabolic Press 1982 (out of print).

Linear equations and least squares calculations

LU triangular factorization of matrices. Relation to Gaussian elimination. Column pivoting. Factorizations of symmetric and band matrices. Iterative methods for linear equations. QR factorization of rectangular matrices by Gram–Schmidt, Givens and Householder techniques. Application to linear least squares calculations. [6]

Polynomial approximation

Interpolation by polynomials. Divided differences of functions and relations to derivatives. Orthogonal polynomials and their recurrence relations. Gaussian quadrature formulae. Peano Kernel theorem and applications. [6]

Appropriate books

- † S.D. Conte and C. de Boor *Elementary Numerical Analysis: an algorithmic approach*. McGraw–Hill 1980 (out of print).
G.H. Golub and C. Van Loan *Matrix Computations*. Johns Hopkins University Press 1996 (out of print).
M.J.D. Powell *Approximation Theory and Methods*. Cambridge University Press 1981 (£25.95 paperback).

Estimation

Review of distribution and density functions, parametric families, sufficiency, Rao–Blackwell theorem, factorization criterion, and examples: binomial, Poisson, gamma. Maximum likelihood estimation. Confidence intervals. Use of prior distributions and Bayesian inference. [5]

Hypothesis testing

Simple examples of hypothesis testing, null and alternative hypothesis, critical region, size, power, type I and type II errors, Neyman–Pearson lemma. Significance level of outcome. Uniformly most powerful tests. Likelihood ratio, and use of likelihood ratio to construct test statistics for composite hypotheses. Generalized likelihood-ratio test. Goodness-of-fit tests and contingency tables. [6]

Linear normal models

The χ^2 , t and F distributions, joint distribution of sample mean and variance, Student’s t -test, F -test for equality of two variances. One-way analysis of variance. [3]

Linear regression and least squares

Simple examples. *Use of software*. [2]

Appropriate books

D.A.Berry and B.W. Lindgren *Statistics, Theory and Methods*. Wadsworth 1996 (£36.00 paperback).

G. Casella and J.O. Berger *Statistical Inference*. Duxbury 2002 (£81.00 hardback).

M.H. DeGroot *Probability and Statistics*. Addison-Wesley 2002 (£42.99 paperback).

† J.A. Rice *Mathematical Statistics and Data Analysis*. Duxbury 1995 (out of print).

Discrete-time chains

Definition and basic properties, the transition matrix. Calculation of n -step transition probabilities. Communicating classes, closed classes, absorption, irreducibility. Calculation of hitting probabilities and mean hitting times; survival probability for birth and death chains. Stopping times and statement of the strong Markov property. [5]

Recurrence and transience; equivalence of transience and summability of n -step transition probabilities; equivalence of recurrence and certainty of return. Recurrence as a class property, relation with closed classes. Simple random walks in dimensions one, two and three. [3]

Invariant distributions, statement of existence and uniqueness up to constant multiples. Mean return time, positive recurrence; equivalence of positive recurrence and the existence of an invariant distribution. Convergence to equilibrium for irreducible, positive recurrent, aperiodic chains *and proof by coupling*. Long-run proportion of time spent in given state. [3]

Time reversal, detailed balance, reversibility; random walk on a graph. [1]

Appropriate books

G.R. Grimmett and D.R. Stirzaker *Probability and Random Processes*. OUP 2001 (£29.95 paperback).

J.R. Norris *Markov Chains*. Cambridge University Press 1997 (£20.95 paperback).

Lagrangian methods

General formulation of constrained problems; the Lagrangian sufficiency theorem. Interpretation of Lagrange multipliers as shadow prices. Examples. [2]

Linear programming in the nondegenerate case

Convexity of feasible region; sufficiency of extreme points. Standardization of problems, slack variables, equivalence of extreme points and basic solutions. The primal simplex algorithm, artificial variables, the two-phase method. Practical use of the algorithm; the tableau. Examples. The dual linear problem, duality theorem in a standardized case, complementary slackness, dual variables and their interpretation as shadow prices. Relationship of the primal simplex algorithm to dual problem. Two person zero-sum games. [6]

Network problems

The Ford-Fulkerson algorithm and the max-flow min-cut theorems in the rational case. Network flows with costs, the transportation algorithm, relationship of dual variables with nodes. Examples. Conditions for optimality in more general networks; *the simplex-on-a-graph algorithm*. [3]

Practice and applications

Efficiency of algorithms. The formulation of simple practical and combinatorial problems as linear programming or network problems. [1]

Appropriate books

† M.S. Bazaraa, J.J. Jarvis and H.D. Sherali *Linear Programming and Network Flows*. Wiley 1990 (£80.95 hardback).

† D. Luenberger *Linear and Nonlinear Programming*. Addison–Wesley 1984 (out of print).
R.J. Vanderbei *Linear programming: foundations and extensions*. Kluwer 2001 (£61.50 hardback).

COMPUTATIONAL PROJECTS 6 lectures (Easter term) plus project work

GENERAL INFORMATION

This course is examined in a different way from other Mathematical Tripos courses. Each project requires practical work on a computer. The emphasis is on the mathematical nature of the project rather than on programming or numerical techniques. Credit for examination purposes is obtained by the submission of written reports and no questions are set in the written papers. There are two core projects which everybody is expected to attempt and a choice of two additional projects from four available. Marks awarded are added to the totals for written papers. The maximum credit available is approximately two thirds of that for a 24 lecture course. The examination credit is not related to the number of lectures, but to the projects which are submitted.

Suitable equipment for the project work is available in the Maths Public Workstation Facility (PWF) situated in the basement of Pavilion G at the Centre for Mathematical Sciences where a demonstrator will be present (at specified times) to give advice and assistance. Appropriate software is provided by the Faculty for this course which may be accessed from the Maths PWF. Similar equipment and software is available at other PWFs at various University sites and in most colleges.

Subject to standard Computing Service rules, the Maths PWF may be used by anyone who is a candidate for the Mathematical Tripos. Excepting unforeseeable circumstances such as hardware failure or power cuts, it is normally open from 8.30 a.m. to 5.30 p.m. every weekday in Full Term (8.30 a.m. to 1.00 p.m. on Saturdays during Michaelmas and Lent terms only). From time to time it may be necessary to reserve the room for other purposes, and the precise opening hours are subject to variations, which will be announced as much in advance as possible.

The software which the Faculty has written and provided specifically for this course is available for use on students' own machines (IBM PC-compatible) but the Faculty cannot undertake to provide copies of any other copyright proprietary software. Students intending to use their own personal equipment may wish to purchase copies of such software for themselves.

Further information on the Computational Projects is available on the Faculty website at <http://www.maths.cam.ac.uk/catam/>

PROJECT WORK

The Faculty publishes a projects booklet by the end of July preceding the Part IB year (i.e., shortly after the end of Term 3). This contains the projects which may be attempted and further details about course administration. Once the booklet is available, the projects may be done at any time up to the submission deadlines, which are near the start of the Full Lent Term in the IB year (i.e. in Term 5) for the two core projects and near the start of the Full Easter Term in the IB year (i.e. in Term 6) for the two additional projects as specified in the projects booklet.

LECTURES

The lectures are given in the Easter Full Term of the Part IA year and are accompanied by introductory practical classes. Students register for these classes: arrangements will be announced during the lectures.

Introduction to course

Examples of the use of computers in mathematics. Overview of course, including administration, marks and computing facilities. Introduction to the projects.

Using Windows and CCATSL elements. Introduction to programming in C (editor, compiler and graphics)

Structure of a program, and programming techniques; manipulation of arrays, iteration and recursion. Basic C commands. Complexity of an algorithm.

Introduction to software libraries and packages

How to call mathematical and graphical software libraries from C with illustrations, for example, numerical solution of ordinary differential equations.

Example project

The key points of how to complete a project should be covered by illustration.

Appropriate books

† Faculty of Mathematics, University of Cambridge *Learning to use C and the CATAM software library*. Available online or from CMS Reception (£2.00).
